Disclaimer

The forewarnings are based on the retrospective disease data available in the NADRES database. Hence, for those states wherein data is limited/less, the forewarning may not be realistic. Further the forewarning will not take into consideration the control measures that are *in situ*.

Acknowledgement

I would like to acknowledge the constant support and inspiration from Hon'ble Secretary, DARE and Director General, ICAR, Government of India, New Delhi.

I would like to express sincere everlasting gratitude to Hon'ble Deputy Director General (Animal Science) for his constant encouragement, support and guidance.

I would also like to express sincere gratitude to the Department of Animal Husbandry and Dairying (DAHD), Ministry of Agriculture and Farmers Welfare, Government of India for providing the livestock population data for the preparation of this bulletin.

Animal Husbandry Departments of state governments and also NADEN centres are gratefully acknowledged for the timely submission of reports of livestock disease outbreak data. I am thankful to all the scientific and technical staff of ICAR-NIVEDI for their feedback and support. I sincerely acknowledge the Statistical Division of DAHD for providing the data on livestock census.

Furthermore, I would also like to acknowledge with much appreciation the crucial role of Dr. K. P. Suresh, Principal Scientist and support received from the scientists, Dr. D. Hemadri, Dr. S.S. Patil, Dr. P. Krishnamoorthy, Dr. S.J. Siju and SRF's, JRF's, Young Professionals and other contractual staff working in Disease Informatics Lab/Spatial Epidemiology Lab in preparing this monthly bulletin.

Director (Acting)

1. ABOUT THE BULLETIN...

Livestock sector plays a crucial role in the rural economy of India as around 20.5 million people depend upon livestock for their livelihood. Even though the investment in the livestock sector is meagre, tremendous achievements have been observed in the sector during the last decade. As it is an important component in poverty alleviation programmes, continuous emphasis is being laid on this sector for enhancing the quality of the primary and secondary products in the international market, which in turn demands improved animal health. Therefore, livestock development programmes cannot succeed unless a well-organized animal health service is built up and in place for safeguarding the livestock against economically important diseases.

India has made a noteworthy success in the eradication of Rinderpest (RP), CBPP, AHS and Dourine. However, there are several other infectious and non-infectious diseases prevailing in the country causing huge annual economic loss. Prevention, control and eradication of the animal diseases need a thorough understanding of the epidemiology as well their economic impact.

National Institute of Veterinary Epidemiology and Disease Informatics (NIVEDI) has the mandate to carry out research activities in the area of veterinary epidemiology and disease informatics. With the eradication of RP successfully, India has not only proved its ability to face the challenges but also to succeed, despite various limitations. Similar efforts are needed to control and eradicate diseases like FMD, PPR, Brucellosis, CSF, HS etc., which cause huge economic loss annually to the livestock industry. To this end, ICAR-NIVEDI has identified 13 priority livestock diseases, based on the past incidence patterns and has built a strong database of these diseases. The database, which is the backbone of the National Animal Disease Referral Expert System (NADRESv2), is used for providing monthly livestock disease forewarning, which is compiled in this monthly bulletin to alert the animal husbandry departments, both at the National/state level, to take appropriate control measures. We hope users/stakeholders find this bulletin useful in their quest to control livestock diseases. This forewarning bulletin will assist the field Veterinarians in adopting appropriate preventive and control measures, thereby reducing the occurrence of livestock disease outbreaks.

2. SUMMARY OF THE FOREWARNING BULLETIN....

The association between infectious diseases and the climate was known from ancient times. Hippocrates observed in the 5th century that epidemics were associated with natural phenomena rather than divinities or demons. In modern times, our increasing capabilities to detect and predict climate variations joined with growing evidence for global climate change, have powered interest in understanding the impacts of climate on animal health, particularly the emergence and transmission of infectious disease agents. Simple reasoning suggests that climate can affect infectious disease patterns because the pathogens (viruses, bacteria, and parasites) and their vectors are sensitive to temperature, moisture, and other ambient environmental conditions.

India being an agriculture-based country, the livestock sector plays a vital role in contributing to the economy. A robust reporting and forewarning system enable the concerned authorities in disease preparedness and awareness of the risk associated with livestock diseases. Therefore, the economic loss due to morbidity and mortality of the animals is reduced thereby helps to increase the productivity in terms of egg, meat, and dairy products. National Animal Disease Referral Expert System database is a weather-based forewarning system enabled with an artificial intelligence system developed by ICAR-National Institute of Veterinary Epidemiology & Disease Informatics Bengaluru, Karnataka state, India that forecast potential threats from pathogens two months in advance to provide the stakeholders with sufficient timeline for awareness and preparedness to act. Artificial Intelligence (AI) and Machine Learning (ML) models use the programmed algorithms that receive and analyse input data to predict output (Infectious risk prediction) values within an acceptable range. As new data fed into these algorithms, they learn and optimize their operations to improve performance, developing intelligence over time.

The livestock disease forewarning for December 2022 revealed Jharkhand, Uttar Pradesh, Karnataka, Kerala Assam and West Bengal as the top states with high predicted livestock disease outbreaks.

Among the predicted diseases, control programmes are in full swing for FMD and PPR in the country and due attention is demanded by the predicted disease outbreaks of these diseases. Among the expected disease outbreaks, the predicted FMD and PPR outbreaks are high in Jharkhand, 21 and 17 respectively. Further the co-occurrence of FMD and HS can be expected in Andhra Pradesh, Gujarat, Jharkhand, Karnataka, Kerala, Madhya Pradesh, Odisha, Rajasthan, Tamil Nadu, Tripura and West Bengal. Among the different diseases in livestock, the predicted outbreaks are expected to be high for Fasciolosis (96), Trypanosomosis (74) and Theileriosis (70).

The major challenges for the effective disease control programme being the lack of thorough understanding about the complexity of disease dynamics, wide host range of pathogens, widening of niche of pathogens due to climate change etc. The effective control programme for major livestock diseases in the country can be efficiently addressed by planning and execution of available control measures in the high-risk areas and routine surveillance and monitoring of diseases.

Table S1. Summary of Statewise Livestock Disease forewarning for December- 2022

Sl. No	State Name	Anthrax	Babesiosis	BQ	BT	ET	Fasciolosis	FMD	HS	PPR	S&G Pox	CSF	Theileriosis	Trypanosomosis	Total number of districts predicted for risk of disease

3.INTRODUCTION TO NADRES v2

The geographic and seasonal distribution of many infectious diseases are associated with climate and therefore the possibility of using seasonal climate forecasts as predictive indicators in disease early warning system (EWS) became imminent. In this context, ICAR-NIVEDI, in its quest for achieving better livestock health, had developed an interactive web portal named “National Animal Disease Referral Expert System (NADRES)” during early part of the first decade of the millennium. The web portal, which was developed from the financial support of National Agricultural Technology Project, was launched in the year 2005. The portal which is interactive, allows the user/stakeholder to access livestock disease forewarning (n=13) at the district level for entire country two months in advance. The portal which was initially built on oracle platform was later changed to MySQL platform to store the administrator provided disease information and other relevant meteorological and risk factor information. However, with the availability of remote sensed satellite images and the advancement in information technology and statistical algorithms, the upgradation of NADRES became inevitable. To this end, a newer version of NADRES (NADRES V2) has been developed and is ready for release.

How it is different from previous version?

In brief, it can be said that NADRES v2 underwent a sea change not only in its internal structure but also in its physical design. As a result, now the central menu bar consists of Home, about us, Risk factors, Analysis, Livestock disease, post prediction validation and contact details. Risk factors menu comprises of details on resolution, time interval, units and source of 11 meteorological and 5 remote sensing parameters. Analytics menu has various analysis options. The newly created livestock disease menu has the details regarding species affected, clinical signs and preventive measures to be adopted for the 13 economically important diseases. Post prediction validation menu contains the outbreak reports vs prediction. The menu bar on the RHS tabs include online GIS, state wise Livestock disease forecast, district wise Livestock disease forecast, Epi-calculator, download links for mobile app, etc. The website now hosts disease maps in the form of choropleth maps for 13 diseases in two time periods (1990-2000 and 2000-2018). Similarly, disease trends plots exhibit periodic regression plots providing future trend for the disease. On the LHS, Login menu is provided for authorized persons to login and enter disease details and other related parameters. Disease maps provide choropleth maps for 13 diseases in two time periods (1990-2000 and 2000-2018) is presented. Disease trends- Periodic regression plots are exhibited for prediction of the diseases. Auto-messaging option has been created to send the reminders in the form of text messages to concerned PI's and Co-PI's of NADEN centers for submission of outbreak reports. This message is sent weekly to all the concerned officials. Additionally, a message is sent to the concerned veterinary officers in Karnataka for initiation of preventive measures for the forewarned diseases at the block level. Plans are in place to incorporate farmers' and local vets' mobile numbers in to the list so that they may be asked to initiate preventive measures for the forewarned diseases.

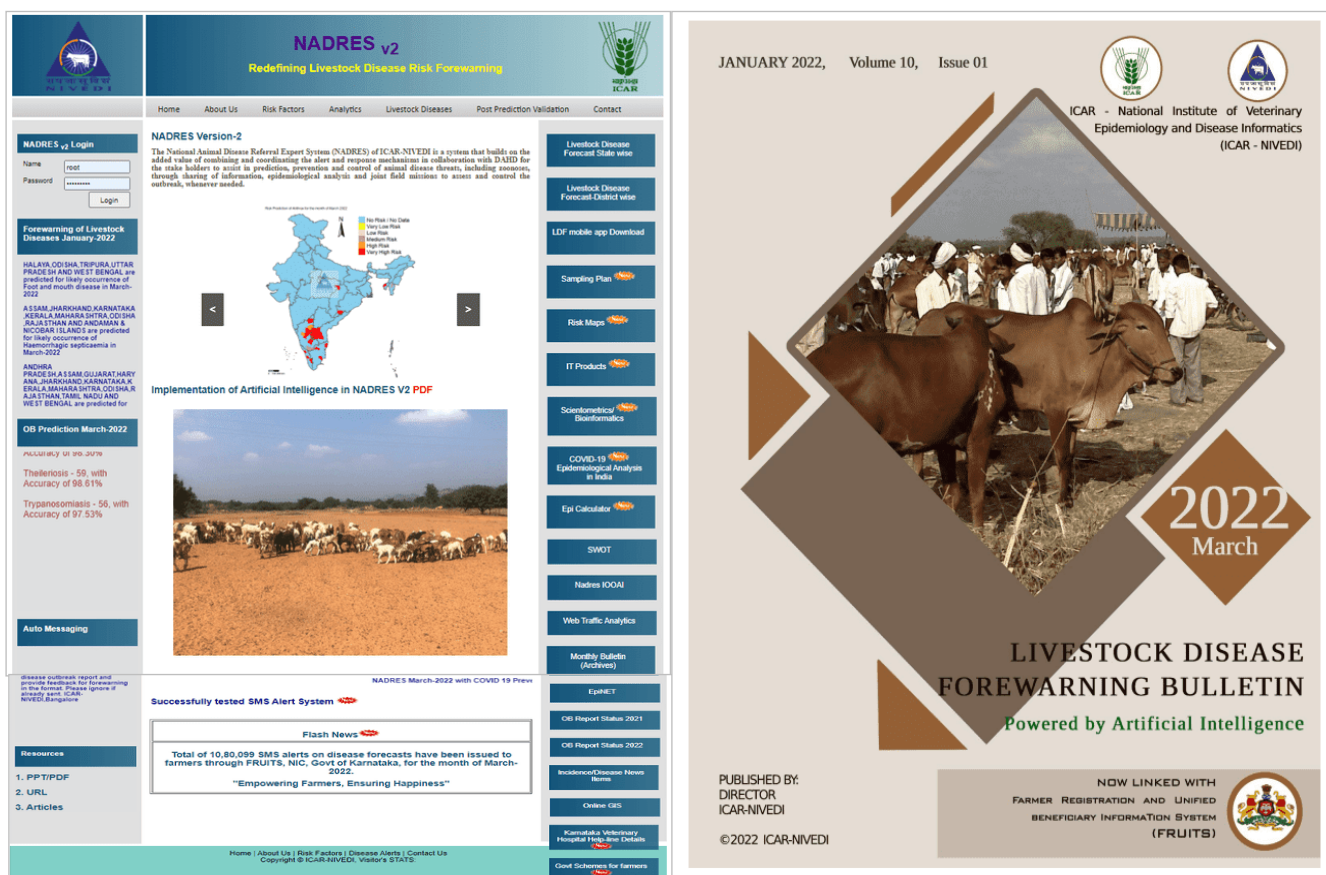

Fig 3.1.NADRES V₂ Home page

The forewarning methodology used is unique and has not been used earlier for livestock disease forewarning in India. Following few paragraphs describe about the forewarning methodology used. It is a well-known fact that weather plays an important role in the precipitation of many diseases and therefore, the climatic parameters such as land surface temperature (LST), precipitation, wind velocity, humidity etc are considered as risk parameters. These parameters along with other non-climatic parameters such as livestock population, density, Normalized Differential Vegetation Index (NDVI), soil moisture constitute the overall risk parameters. A total of 24 such parameters are collected/generated at village level and then aggregated to district level before these are used for analysis.

In addition to the output provided at interactive web portal, the NADRES output are also published in the form of monthly livestock disease forewarning bulletins. The prediction results come with a disclaimer that forewarnings do not take into account of the control measures that already in situ and also may not be realistic for those regions where the data is either unavailable or limited. This bulletin provides the likely occurrence of the 13 shortlisted diseases two months in advance at the district level, disease forewarning maps, prediction accuracy, details on diseases, species affected, clinical signs and its preventive measures.

In summary, it can be said that NADRES v₂ has underwent substantial changes not only in its internal structure but also in its physical design and can be a useful tool for visitors of the website, farmers, vets, policy makers etc.

4. Forewarning Methodology

Preamble

NADRES v2 is an early warning system powered by Artificial Intelligence with set of capacities needed to generate and disseminate timely and meaningful warning information that enables at-risk livestock population, farmers and organizations to prepare and act appropriately and in sufficient time to reduce the livestock disease incidence.

Objectives

- Development of forecasting model for the major livestock diseases and predicting the risk of livestock diseases in advance of two months.
- Development of state of art of communication models to communicate risk of livestock diseases to the stake holders.

I. Materials and data acquisition

Livestock disease data

Previous 10 years' livestock disease outbreak data retrieved from the NADRES database linked with Risk factors data.

Livestock population data

The population data at village level for five major livestock species viz., cattle, buffalo, sheep, goat and pigs were obtained from 20th Livestock census (2019) from Department of statistics, DAHD, GOI.

Species-wise & Category-wise Livestock Population (in thousands)					
SI No	Species	Category	Population in 2012	Population in 2019	% Change
1	Cattle	Exotic	39732	51356	29.3
		Indigenous	151172	142106	-6
		Total	190904	193462	1.3
2	Buffalo	Total	108702	109852	1.1
3	Sheep	Exotic	3781	4088	8.1
		Indigenous	61288	70172	14.5
		Total	65069	74260	14.1
4	Goat	Total	135173	148885	10.1
5	Pig	Exotic	2456	1897	-22.8
		Indigenous	7837	7159	-8.7
		Total	10293	9056	-12
6	Yaks	Total	77	58	-24.7
7	Mithuns	Total	298	386	29.5
8	Horses & Ponies	Total	625	342	-45.3
9	Mules	Total	196	84	-57.1
10	Donkeys	Total	319	124	-61.1
11	Camels	Total	400	252	-37
Total Livestock			512056	536761	4.8

Meteorological and Remotely Sensed Data:

The parameters such as air temperature ($^{\circ}\text{C}$), perceptible water (mm), pressure (millibar), relative humidity (%) and sea level pressure (millibar) were extracted from National Centre for environmental prediction (NCEP). The parameters such as potential evapotranspiration (PET), Enhanced Vegetation Index (EVI), Leaf Area Index (LAI), Land Surface Temperature (LST), Normalised Difference Vegetation Index (NDVI) were extracted from remote sensed images from MODIS website (<https://modis.gsfc.nasa.gov/>). In brief, the MODIS products from NASA-TERRA satellite was downloaded for the Indian locations by specifying the tiles (H24V5, H25V6, H24V6, H24V7, H25V7, H25V8, H26V7, H26V6) from 2001 to till date.

The details are given below;

PRODUCT	Science Data Sets (HDF Layers)
MOD15A2H	Lai_500m (Leaf area index) 8 days average
MOD16A2	PET_500m (Total Potential Evapotranspiration) 8 days average
MOD11A2	LST_Day_1km (Daytime Land Surface Temperature) 8 days average
MOD13A1	i. 500m 16 days NDVI (Normalized Difference Vegetation Index) ii. Enhanced Vegetation Index (EVI) 16 days average

The downloaded HDF files (Datasets, which are multidimensional arrays (layers) of a homogeneous type) were converted to GeoTIFF files (single layer data) using R packages, which were later used to extract the parameters by linking it with the sinusoidal values of the Indian villages. The scale factors were multiplied for the extracted values as specified by the MODIS data products to get the values of the parameters. As shown above, the atmospherically corrected NDVI was collected on 16-day interval at 250-meter resolution using MODIS product MOD13A1 and LST was collected on 8-day interval using MOD11A2 at 1 KM resolution.

The parameters such as rainfall, soil moisture and wind speed were obtained from Global Land DataAssimilation System of NASA (<https://disc.gsfc.nasa.gov>). The remaining parameters were downloaded from climatic research unit (CRU) of University of East Anglia website. It is worth mentioning that the entire process of extraction, assimilation, processing and aligning have been done using R programming language and R environment. After aligning the climatic and non-climatic data with the disease and the livestock population data (aggregated at the district level), the statistical analysis was performed in the R environment.

Initially, two regression models and six machine learning models were applied to test their suitability to fit the data and in all, three models; one regression model (Generalized Linear Model (GLM) and two machine learning models, *viz.*, Gradient Boosting Machine Learning Algorithm (GBM) and Random Forest (RF), which fitted to data well were incorporated for the purpose of disease prediction. The models were trained using the case and control data available at ICAR-NIVEDI. Validation of the models were done by dividing the total observations for a particular disease into marker samples and validation samples and accuracy was tested in terms of discrimination power, which was done using Receiving Operating Characteristics (ROC), Cohen Kappa (Heildke Skill Score) and True Skill statistics (TSS). Once the models produce the probability value, it was used for categorizing the risk. Briefly, when all the models produce the p value of more than 0.5, then the highest p value is used for determining the high-risk category. If all the models or any one model produces the p value of less than 0.5, then the lowest p value was used for categorizing lower risk. This was done to minimize the false alert. Thus, the risk predictions based on the probability values ranging from 0-1 are made as follows; Very High Risk ($p=0.81-1.0$), High Risk ($p=0.61-0.80$), Moderate Risk ($p=0.41-0.60$), Low Risk ($p=0.21-0.40$), Very Low Risk ($p=0.0-0.20$) and No Risk ($p=0.0$) for the occurrence of a said disease. It is believed that categorizing districts in to various risk categories will help the stake holders to effectively utilize the available resources (money and manpower).

II. NADRES v2 Data Flow and Data Processing Diagram

A) Data Flow Diagram:

Fig 4.1. NADRES v2 Data Flow Diagram.

B) Artificial Intelligence enabled Data Capturing and Forewarning System:

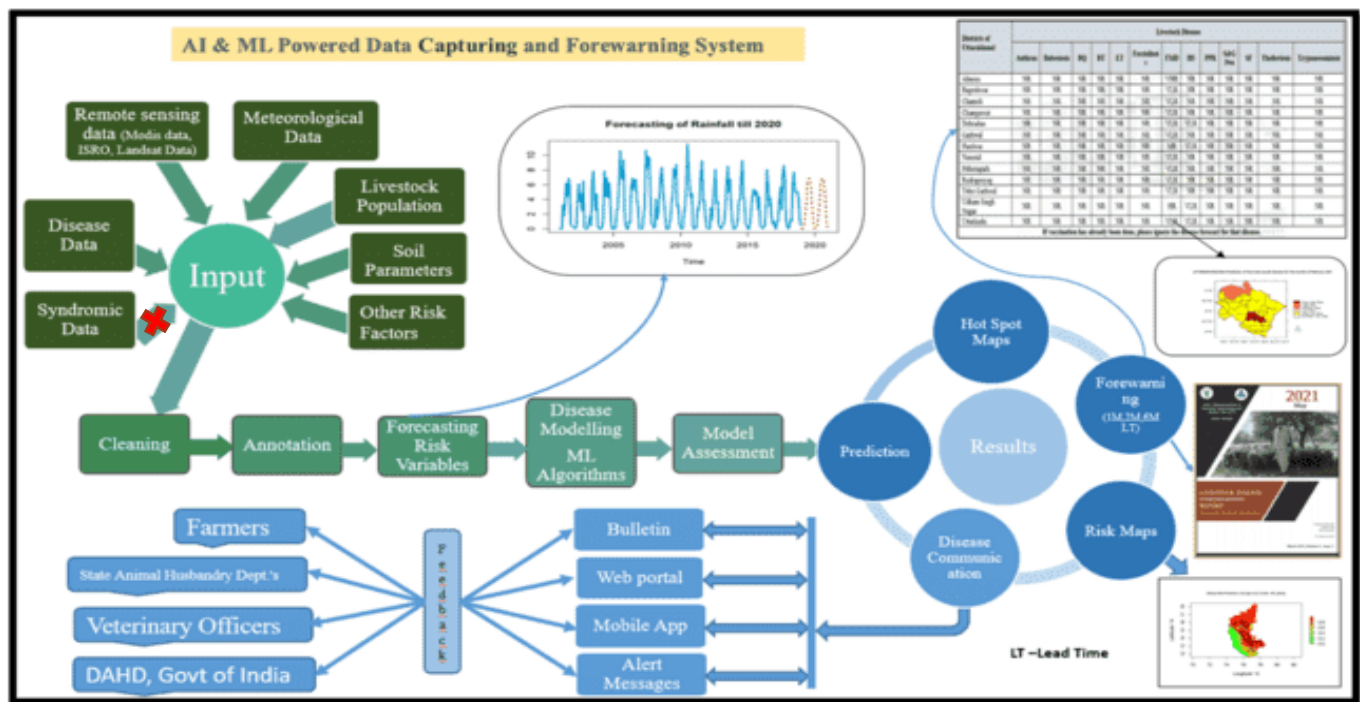

Fig 4.2. Data Capturing and Forewarning system

III. Weighted Outbreak Score

The outbreak data for the month of forecasting is extracted from NADRES database for the period of 10 years from current year. Outbreak data of 13 important livestock diseases are considered. The data is aggregated at district level and the weighted score is defined based on the number of outbreaks for each district in each month considering last 10 years. The weightage score was assigned as 0 for less than three number of outbreaks in the last 10 years for selected month, score 1 for 3–6 number of outbreaks and 2 for more than 6 outbreaks. This weightage score for each district is labelled as risk variable in building the models and risk maps.

Fig 4.3. Top ten livestock diseases (2021)

IV. Forecasting of Weather Parameters

Weather forecasting has been one of the most challenging problems around the world because of both its practical value in meteorology and the popular sphere for scientific research. Weather forecast systems are among the most complex equation systems that computer has to solve. A great quantity of data, coming from satellites, ground stations and sensors located around our planet send daily information that must be used to foresee the weather situation in next hours and days all around. Weather forecasts provide critical information about future weather. There are various techniques involved in weather forecasting, from relatively simple observation of the sky to highly complex computerized mathematical models. Further, forecast products by Indian Metrological department were used for validation of our forecasts (https://mausam.imd.gov.in/imd_latest/contents/extendedrangeforecast.php).

Following are the basic steps of forecasting process:

1. Determine the forecast's purpose
2. Establish a time horizon
3. Select a forecasting technique
4. Gather and analyse data
5. Perform the forecast
6. Monitor the forecast and use it in prediction of disease

Statistical Models used for forecasting of weather and remotely sensed variables

ARIMA stands for Autoregressive Integrated Moving Average. ARIMA is also known as Box-Jenkins approach. Box and Jenkins claimed that non-stationary data can be made stationary by differencing the series, Y_t . The general model for Y_t is written as,

$$Y_t = \phi_1 Y_{t-1} + \phi_2 Y_{t-2} \dots \phi_p Y_{t-p} + \epsilon_t + \theta_1 \epsilon_{t-1} + \theta_2 \epsilon_{t-2} + \dots \theta_q \epsilon_{t-q}$$

Where, Y_t is the differenced time series value, ϕ and θ are unknown parameters and ϵ are independent identically distributed error terms with zero mean. Here, Y_t is expressed in terms of its past values and the current and past values of error terms.

The ARIMA Model combines three basic Methods:

- Auto Regression (AR) – In auto-regression the values of a given time series data are regressed on their own lagged values, which is indicated by the “p” value in the model.
- Differencing (I-for Integrated) – This involves differencing the time series data to remove the trend and convert a non-stationary time series to a stationary one. This is indicated by the “d” value in the model. If $d = 1$, it looks at the difference between two-time series entries, if $d = 2$ it looks at the differences of the differences obtained at $d = 1$, and so forth.
- Moving Average (MA) – The moving average nature of the model is represented by the “q” value which is the number of lagged values of the error term.

This model is called Autoregressive Integrated Moving Average or ARIMA (p, d,q) of Y_t . We will follow the steps enumerated below to build our model. ARIMA models were run in 18 combinations of p, d, q. Based on the minimum AIC value, the order of ARIMA model was selected. This order was used for the prediction of all the weather parameters used in developing disease forewarning models.

V. Implementation of Principal Component Analysis

Large datasets are gradually common and are often difficult to interpret. Principal Component Analysis (PCA) is a technique for reducing the dimensionality of such datasets, increasing the interpretability but at the same time, minimizing the information loss. The PCA is employed in NADRES v2 by creating new uncorrelated variables that successively maximize the variance. This means that ‘preserving as much variability as possible’ translates into finding new variables that are linear functions of those in the original dataset, that successively maximize variance and that are uncorrelated with each other. Determining such new variables, the principal components (PCs) reduce to solve an eigenvalue/eigenvector problem. PCA can be based on either covariance matrix or the correlation matrix and the main use of PCA are descriptive.

In the present study, all the meteorological and remote sensing variables are considering for PCA, with correlation matrix, the final output of principal components which are independent of each were considered for further ML modelling and risk estimation.

VI. Machine Learning Models

Disease outbreak data were aligned with generated risk variables to the respective latitude and longitude, which were subjected to climate-disease modelling. A number of models were fit to aligned data and tested for accuracy in terms of discrimination power. Two regression models, Generalized Linear Models (GLM) and Generalized Additive Models (GAM) and six machine learning algorithms, i.e. Random Forest (RF), Boosted Regression Tree (BRT), Artificial Neural Network (ANN), Multiple Adaptive Regression Spline (MARS), Flexible Discriminant Analysis (FDA) and Classification Tree Analysis (CTA) were employed for disease modelling. Different modelling methods return different types of ‘model object’ and all these model objects could be used for the predict function to make predictions for any combinations of values of independent variables. Response plots were created to explore and understand model predictions.

The fitted models were assessed for their discriminating power using Receiving Operating Characteristic (ROC) curve, Cohen’s Kappa (Heildke Skill Score) and True Skill Statistics (TSS). These measures were used to evaluate the quality of predictions based on presence-absence data. Raster Stack was used to combine the results of individual predictions by different model methods. All the models were assessed for overfitting.

The outcome of best fitted models was in probability of disease occurrence and was categorised into 6 risk levels as No risk (NR), Very low risk (VLR), Low risk (LR), Moderate risk (MR), High risk (HR) and Very high risk (VHR) for enabling the stakeholders to take appropriate control measures by suitably allocating available resources.

5. ACCURACY OF PREDICTION

Serial No.	Diseases	Accuracy (%)
1.	Anthrax	99.38
2.	Babesiosis	97.84
3.	Black quarter	95.83
4.	Bluetongue	98.77
5.	Enterotoxaemia	99.69
6.	Fasciolosis	97.84
7.	Foot and mouth disease	94.91
8.	Haemorrhagic septicaemia	95.22
9.	Peste des petits ruminants	96.91
10.	Sheep & Goat pox	99.07
11.	Classical Swine fever	99.07
12.	Theileriosis	98.92
13.	Trypanosomosis	99.69

Aggregation and prediction of livestock diseases at district level leading to higher accuracy.

- **Formula Used:** The **Accuracy** of disease prediction was calculated using the following formula.

$$\frac{TP + TN}{Total} * 100$$

TP-True Positive Observations, TN-True Negative Observations, Total- Total observations.

- Internal Accuracy was performed using 10 years of data. Accuracy obtained was >90% for all the diseases predicted.
- Despite the power of climate and disease risk models, considerable uncertainties remain, identifying these uncertainties, highlighting importance of improved data may improve the model accuracy, realism, confidence, together with translating uncertainties in model inputs into uncertainties in model outputs, are important benefits of modelling.

6. MORAN'S I FOR CLUSTERING OF LIVESTOCK DISEASES

Moran's I is a tool that measures spatial autocorrelation (feature similarity) based on both feature locations and feature values simultaneously. Given a set of features and an associated attribute, it evaluates whether the pattern expressed is clustered, dispersed, or random. The tool calculates the Moran's I Index value and both a Z score and p-value evaluating the significance of that index. In general, a Moran's Index value near +1.0 indicates clustering while an index value near -1.0 indicates dispersion.

Autocorrelation tool, the null hypothesis states that "there is no spatial clustering of the values associated with the geographic features in the study area". When the p-value is small and the absolute value of the Z score is large enough that it falls outside of the desired confidence level, the null hypothesis can be rejected. If the index value is greater than 0, the set of features exhibits a clustered pattern. If the value is less than 0, the set of features exhibits a dispersed pattern.

7. R SOFTWARE

R is a programming language and software environment for statistical analysis, graphics representation and reporting. R is a simple and effective programming language, which includes conditionals, loops, user defined recursive functions and input and output facilities. R statistical software version 3.1.3 (version 3.4.3, R Foundation for Statistical Computing, Vienna, Austria. <https://www.R-project.org/>) was used as an integrated suite for data mining, calculation and graphical display. Several R packages like *openxlsx*, *raster*, *RMySQL*, *rgdal*, *RColorBrewer*, *sqldf*, *sp*, *spdep*, *xlsx*, *plyr*, *randomFores*, *dismo*, *SDMTool*, *dplyr*, *tmap* and *data table* were used for data extraction, data alignment, annotation, analysis, modelling and risk mapping.

8. FOREWARNING OF LIVESTOCK DISEASE FOR THE MONTH OF DECEMBER, 2022

II) Glimpse about the risk of predicted diseases:

The Livestock disease risk obtained based on the Machine Learning algorithm were further categorized into risk events using High Risk and Very High Risk.

1. Andaman and Nicobar

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Nicobars, North & Middle Andaman and South Andaman	Three	Babesiosis
2.	Nicobars and South Andaman	Two	Fasciolosis

2. Andhra Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Kurnool and Sri Potti Sriramulu Nellore	Two	Anthrax
2.	Anantapur	One	Blue Tongue
3.	Chittoor	One	Foot and Mouth Disease
4.	East Godavari, Kurnool and Y.S.R.	Three	Haemorrhagic Septicaemia
5.	Krishna	One	Peste des Petits Ruminants
6.	Krishna and Y.S.R.	Two	Sheep & Goat pox

3. Arunachal Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Kurung Kumey	One	Fasciolosis
2.	Changlang	One	Classical Swine fever

4. Assam

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Cachar, Dhemaji, Dhubri, Kamrup Metropolitan and Sonitpur	Five	Babesiosis
2.	Dhemaji, Dhubri, Dibrugarh, Golaghat, Karbi Anglong and Sonitpur	Six	Black Quarter
3.	Darrang, Nalbari and Udalguri	Three	Enterotoxaemia

4.	Chirang, Dhemaji, Dhubri, Dibrugarh, Golaghat, Jorhat, Kamrup, Lakhimpur, Nagaon, Sivasagar and Sonitpur	Eleven	Fasciolosis
5.	Sonitpur	One	Haemorrhagic Septicaemia
6.	Baksa and Kamrup	Two	Peste des Petits Ruminants
7.	Darrang	One	Sheep & Goat pox
8.	Baksa, Cachar, Darrang, Dhemaji, Dibrugarh, Dima Hasao, Goalpara, Golaghat, Hailakandi, Jorhat, Kamrup, Kamrup Metropolitan, Karbi Anglong, Lakhimpur, Nalbari, Sivasagar and Sonitpur	Seventeen	Classical Swine fever
9.	Tinsukia	One	Theileriosis

5. Bihar

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Bhojpur and Khagaria	Two	Babesiosis
2.	Bhojpur	One	Fasciolosis
3.	Gaya, Muzaffarpur, Samastipur and Vaishali	Four	Foot and Mouth Disease
4.	Gaya	One	Peste des Petits Ruminants
5.	Patna	One	Classical Swine fever
6.	Bhojpur, Buxar and Khagaria	Three	Trypanosomiasis

6. Chattisgarh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Koriya	One	Anthrax

7. Goa

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	North Goa	One	Babesiosis

8. Gujarat

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Junagadh	One	Foot and Mouth Disease
2.	Banas Kantha, Bhavnagar and Gandhinagar	Three	Haemorrhagic Septicaemia
3.	Ahmadabad and Porbandar	Two	Peste des Petits Ruminants
4.	Bhavnagar and Rajkot	Two	Sheep and goat pox
5.	Amreli	One	Theileriosis
6.	Patan	One	Trypanosomiasis

9. Haryana

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Hisar	One	Enterotoxaemia
2.	Hisar	One	Foot and Mouth Disease
3.	Bhiwani	One	Peste des Petits Ruminants
4.	Panipat	One	Classical Swine fever
5.	Hisar	One	Theileriosis

10. Himachal Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Kangra and Mandi	Two	Foot and Mouth Disease
2.	Hamirpur	One	Peste des Petits Ruminants
3.	Mandi	One	Sheep & Goat pox

11.Jammu & Kashmir

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Anantnag, Badgam, Bandipore, Ganderbal, Kulgam, Kupwara, Pulwama and Srinagar	Eight	Sheep & Goat pox

12.Jharkhand

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Khunti, PashchimiSinghbhum and PurbiSinghbhum	Three	Anthrax
2.	All districts	Twenty-four	Babesiosis
3.	Bokaro, Chatra, Deoghar, Dhanbad, Dumka, Giridih, Gumla, Hazaribagh, Jamtara, Koderma, Latehar, Lohardaga, Pakur, PashchimiSinghbhum, PurbiSinghbhum, Ranchi, Sahibganj, Seraikela - Kharsawan	Eighteen	Black Quarter
4.	Deoghar, Dhanbad, Giridih, Gumla, Khunti, Koderma, Palamu, PashchimiSinghbhum, Ramgarh, Sahibganj and Seraikela - Kharsawan	Eleven	Enterotoxaemia
5.	All districts except Koderma and Seraikela - Kharsawan	Twenty-two	Fasciolosis
6.	All the districts except Garhwa, Koderma and Seraikela - Kharsawan	Nineteen	Foot and Mouth Disease
7.	Chatra, Deoghar, Dhanbad, Dumka, Giridih, Hazaribagh, Jamtara, Khunti, Pakur, Palamu, PurbiSinghbhum and Sahibganj	Twelve	Haemorrhagic Septicaemia
8.	Bokaro, Chatra, Deoghar, Dhanbad, Dumka, Gumla, Hazaribagh, Jamtara, Khunti, Latehar, Lohardaga, Pakur, PashchimiSinghbhum, PurbiSinghbhum, Ranchi, Sahibganj and Simdega	Seventeen	Peste des Petits Ruminants
9.	Khunti, PashchimiSinghbhum, Ranchi and Sahibganj	Four	Sheep & Goat pox
10.	Bokaro, Dhanbad, Dumka, Gumla, Lohardaga, Pakur, PashchimiSinghbhum and Ranchi	Eight	Classical Swine fever
11.	All the districts	Twenty-four	Theileriosis
12.	All the districts	Twenty-four	Trypanosomosis

13. Karnataka

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Bangalore Rural, Bellary, Chamarajanagar, Chikkaballapura, Davanagere, Koppal, Mandya, Ramanagara and Tumkur	Nine	Anthrax
2.	Bangalore, Bangalore Rural, Bellary, Bidar, Chamarajanagar, Chikmagalur, Chitradurga, Gulbarga, Hassan, Mandya, Mysore, Shimoga, Tumkur and Yadgir	Forteen	Black Quarter
3.	Bellary, Chitradurga, Davanagere, Kolar, Koppal, Mysore, Ramanagara and Tumkur	Eight	Blue Tongue
4.	Bidar, Chikkaballapura, Gadag, Haveri, Kolar, Koppal, Shimoga and Tumkur	Eight	Enterotoxaemia
5.	Bangalore, Bangalore Rural, Chamarajanagar, Chikkaballapura, Chikmagalur, Dakshina Kannada, Hassan, Kodagu, Mandya, Ramanagara and Tumkur	Eleven	Foot and Mouth Disease
6.	Chamarajanagar, Chikmagalur, Hassan, Mandya and Yadgir	Five	Haemorrhagic Septicaemia
7.	Kolar and Tumkur	Two	PestidesPetits Ruminants
8.	Bangalore, Chikmagalur, Chitradurga, Davanagere, Gadag, Haveri, Koppal, Shimoga and Tumkur	Nine	Sheep & Goat pox
9.	Bangalore, Bangalore Rural and Bidar	One	Classical Swine fever

14. Kerala

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Kozhikode	Two	Anthrax
2.	Ernakulam, Malappuram, Thiruvananthapuram and Thrissur	Four	Babesiosis
3.	Thiruvananthapuram	One	Enterotoxaemia
4.	All the districts except Kasaragod	Thirteen	Foot and Mouth Disease
5.	Kollam, Kottayam and Wayanad	Three	Haemorrhagic Septicaemia
6.	Alappuzha, Ernakulam, Idukki, Kannur, Palakkad and Thiruvananthapuram	Six	Pest des Petits Ruminants
7.	Idukki	One	Classical Swine fever
8.	All the districts except Alappuzha and Idukki	Twelve	Theileriosis
9.	Alappuzha, Ernakulam, Kannur, Kozhikode, Malappuram, Palakkad, Thiruvananthapuram, Thrissur and Wayanad	Nine	Trypanosomiasis

15. Madhya Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Barwani, Bhopal, Raisen and Shivpuri	Four	Foot and Mouth Disease
2.	Bhopal and Sagar	Two	Haemorrhagic Septicaemia
3.	Narsimhapur	One	Trypanosomiasis

16. Maharashtra

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Ahmadnagar	One	Black Quarter
2.	Dhule	One	Haemorrhagic Septicaemia
3.	Ahmadnagar, Aurangabad, Jalgaon, Nashik and Pune	Five	Peste des Petits Ruminants
4.	Ahmadnagar	One	Sheep & goat pox
5.	Akola	One	Theileriosis

17. Manipur

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Churachandpur and Tamenglong	Two	Black Quarter
2.	Imphal West and Thoubal	Two	Fasciolosis
3.	Bishnupur, Imphal West and Senapati	Three	Foot and Mouth Disease
4.	Imphal West	One	Classical Swine fever

18. Meghalaya

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	East Jaintia Hills, Southwest Garo Hills and West Khasi Hills	Three	Black Quarter
2.	East Khasi Hills and West Khasi Hills	Two	Foot and Mouth Disease
3.	Southwest Garo Hills	One	Classical Swine fever

19. Mizoram

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Aizawl	One	Black Quarter
2.	Aizawl and Mamit	Two	Classical Swine fever

20. Nagaland

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Mon and Phek	Two	Classical Swine fever

21. Odisha

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Mayurbhanj	One	Anthrax
2.	Ganjam, Khordha, Malkangiri, Nayagarh and Rayagada	Five	Black Quarter
3.	Jagatsinghapur and Khordha	Two	Enterotoxaemia
4.	Cuttack, Dhenkanal, Ganjam, Jagatsinghapur, Jajapur, Nabarangapur, Sambalpur and Sundargarh	Eight	Foot and Mouth Disease
5.	Jajapur, Khordha, Puri and Rayagada	Four	Haemorrhagic Septicaemia
6.	Baudh and Khordha	Two	Peste des Petits Ruminants
7.	Ganjam, Kendujhar, Khordha, Subarnapur and Sundargarh	Five	Sheep & Goat pox

22. Puducherry

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Karaikal, Mahe and Puducherry	Three	Babesiosis
2.	Puducherry and Yanam	Two	Fasciolosis
3.	Karaikal	One	Foot and Mouth Disease
4.	Puducherry	One	Sheep & Goat pox

23. Punjab

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Hoshiarpur	One	Fasciolosis
2.	Sangrur	One	Haemorrhagic Septicaemia
3.	Patiala	One	Peste des Petits Ruminants
4.	Patiala	One	Classical Swine fever

24. Rajasthan

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Ganganagar and Jodhpur	Two	Black Quarter
2.	Banswara	One	Fasciolosis
3.	Alwar, Ganganagar, Jaipur, Jhunjhunun, Sikar and Tonk	Six	Foot and Mouth Disease
4.	Jaipur and Rajsamand	Two	Haemorrhagic Septicaemia
5.	Jaisalmer and Jhalawar	Two	Peste des Petits Ruminants

25. Sikkim

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	East District	One	Theileriosis

26. Tamil Nadu

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Coimbatore, Ramanathapuram, Tiruvannamalai, Vellore and Viluppuram	Five	Anthrax
2.	Dindigul, Kancheepuram, Ramanathapuram and Viluppuram	Four	Foot and Mouth Disease
3.	Thiruvallur	One	Haemorrhagic Septicaemia
4.	Thiruvallur and Thoothukkudi	Two	Peste des Petits Ruminants
5.	Ramanathapuram, Salem and Sivaganga	Three	Sheep & Goat pox

27. Tripura

Sl. No	Disease prone districts	Number of disease prone for districts	Disease Name
1.	North Tripura, South Tripura and West Tripura	Three	Babesiosis
2.	North Tripura, South Tripura and West Tripura	One	Blue Quarter
3.	Dhalai, South Tripura and West Tripura	Three	Fasciolosis

4.	South Tripura and West Tripura	Two	Foot and Mouth Disease
5.	South Tripura and West Tripura	Two	Haemorrhagic Septicaemia
6.	South Tripura	One	Peste des Petits Ruminants
7.	Dhalai, North Tripura and South Tripura	Three	Sheep & Goat pox
8.	North Tripura, South Tripura and West Tripura	Two	Classical Swine fever

28. Uttar Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Allahabad, Ballia, Banda, Budaun, Etah, Fatehpur, Gonda, Gorakhpur, Jalaun, Kanpur Nagar, Kheri, Kushinagar, Mirzapur and onbhadra	Forteen	Babesiosis
2.	Banda	One	Enterotoxaemia
3.	Ballia, Jaunpur, Kheri, Meerut, Sant Ravidas Nagar (Bhadohi) and Varanasi	Six	Fasciolosis
4.	Muzaffarnagar	One	Foot and mouth disease
5.	Bareilly, Basti, Fatehpur, Gonda, Gorakhpur, Hardoi, Kanpur Nagar and Moradabad	Eight	Peste des Petits Ruminants
6.	Allahabad, Ballia, Banda, Etah, Fatehpur, Gonda, Gorakhpur, Kushinagar, Lalitpur, Mahrajganj, Mathura, Meerut, Mirzapur, Moradabad, Rae Bareli, Saharanpur and Sitapur	Seventeen	Theileriosis
7.	Aligarh, Allahabad, Ambedkar Nagar, Bahraich, Ballia, Banda, Bara Banki, Bareilly, Bijnor, Budaun, Etah, Farrukhabad, Fatehpur, Gonda, Gorakhpur, Hardoi, Jalaun, Jaunpur, Kanpur Nagar, Kheri, Kushinagar, Lalitpur, Mahrajganj, Mainpuri, Mathura, Meerut, Mirzapur, Moradabad, Pratapgarh, Rae Bareli, Sant Ravidas Nagar (Bhadohi), Sitapur, Sonbhadra, Sultanpur, Unnao and Varanasi	Thirt-six	Trypanosomosis

29. Uttarakhand

Sl. No	Disease prone districts	Number of disease prone for districts	Disease Name
1.	Almora, Hardwar and Nainital	Three	Foot and Mouth disease

30. West Bengal

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Bankura and Murshidabad	Two	Anthrax
2.	Bankura, Bardhaman, Dakshin Dinajpur, Haora, Jalpaiguri, Koch Bihar, Purba Medinipur and South Twenty Four Parganas	Eight	Black quarter
3.	Purba Medinipur	One	Fasciolosis
4.	Bankura, Birbhum, Jalpaiguri, Nadia, Paschim Medinipur, Purba Medinipur and Uttar Dinajpur	Seven	Foot and Mouth Disease
5.	Bankura, Bardhaman, Birbhum, Dakshin Dinajpur, Hugli, Maldah, Paschim Medinipur and Puruliya	Eight	Peste des Petits Ruminants
6.	Hugli and Puruliya	Two	Haemorrhagic Septicaemia
7.	Bardhaman, Nadia, North Twenty Four Parganas and Purba Medinipur	Four	Sheep & Goat pox
8.	Bankura, Bardhaman, Birbhum, Haora, Hugli, Maldah, Nadia, North Twenty Four Parganas, Paschim Medinipur, Purba Medinipur and South Twenty Four Parganas	Eleven	Theileriosis

iii) Diseases, Species affected, Clinical signs and its preventive measures.

Sl No.	Disease	Species Affected	Clinical Signs	Preventive Measures
1	Anthrax (AX)	Most of the mammals and ruminants are highly susceptible. Pigs and Horses are moderately susceptible. Carnivores are relatively resistant.	Convulsion and sudden death with oozing of blood from natural orifices such as rectum and nose prior to death. Occasionally oedema develops in the throat and shoulder over a period of one week before death.	Ring vaccination and reporting of the disease is advised. Vaccination to be done in consultation with the veterinarians and as decided by state animal husbandry authorities. Strict biosecurity measures may be followed. Carcass may be disposed by deep burying covered with lime powder. Contaminated area may be disinfected with 4% formalin or 10% caustic soda. Grazing area may be restricted.
2	Babesiosis (BA)	Cattle. Cross breeds are more susceptible.	High temperature, jaundice like symptoms, yellowish mucosal membrane of eye, rectum and coffee colour urine.	Periodical application of acaricides in and around the animal shed and on the animals. For therapeutic application, Diaminazine or Imidocarb can be useful.
3.	Black Quarter (BQ)	Common disease of cattle and sheep, but occasionally goats and pigs also suffer from the disease.	High fever and lameness followed by swelling in the neck, shoulder, lumbar, gluteal and sacral regions. Skin over the affected area become dark and crepitate on palpation. Loss of feed intake, colic, lateral recumbency, dyspnoea and death.	Affected animals may be treated with suitable antibiotics. Vaccination to be done in consultation with the veterinarians and as decided by state animal husbandry authorities. Strict biosecurity measures may be followed. Grazing area may be restricted. Carcass may be disposed hygienically.

4.	Bluetongue (BT)	Sheep are more susceptible than goats.	Fever, swelling of face, neck, eyelids respiratory distress, nasal discharge, Salivation, necrotic ulcers on tongue, dental pad, gum, lips hyperaemia of muzzle and may bleed at muco-cutaneous junction. Affected tongue may become swollen, cyanotic and purple blue in colour – 'bluetongue'.	Vector control using insecticides and good water management. Vaccination of susceptible animals preferably in the month of May. Do not shear sheep during winter months. Restriction in animal movement, segregation of affected animals and symptomatic treatment. Strict biosecurity measures.
5.	Enterotoxaemia (ET)	Common disease of sheep and goats especially among the young animals.	Dullness, opisthosomas, convulsions, coma and sudden death. Affected adult sheep, which survive for several days May show diarrhoea and staggering.	Affected animals may be treated with suitable antibiotics. Vaccination to be done in consultation with the veterinarians and as decided by State Animal Husbandry Authorities. Strict biosecurity measures may be followed. Carcass may be disposed hygienically. Grazing area to be restricted, stall fed, vitamins and probiotics may be provided.
6.	Fasciolosis(FA)	Cattle, buffalo, sheep and goats.	Progressive anaemia, pale mucous membrane, sub-mandibular oedema (Bottle jaw), loss of appetite, weakness, isolated from flock while grazing, loss in production.	The animal should not be allowed to graze in water stagnant fields or submerged fodder should not be given directly to the animals. The submerged fodder can be processed through hay/silage preparation in order to destroy the metacercariae. The affected animals can be treated with Carbon tetrachloride/ Rafoxanide/Nitroxynil/ Niclofolan/Closantel/Oxyclozanide, under the strict supervision of veterinarian.

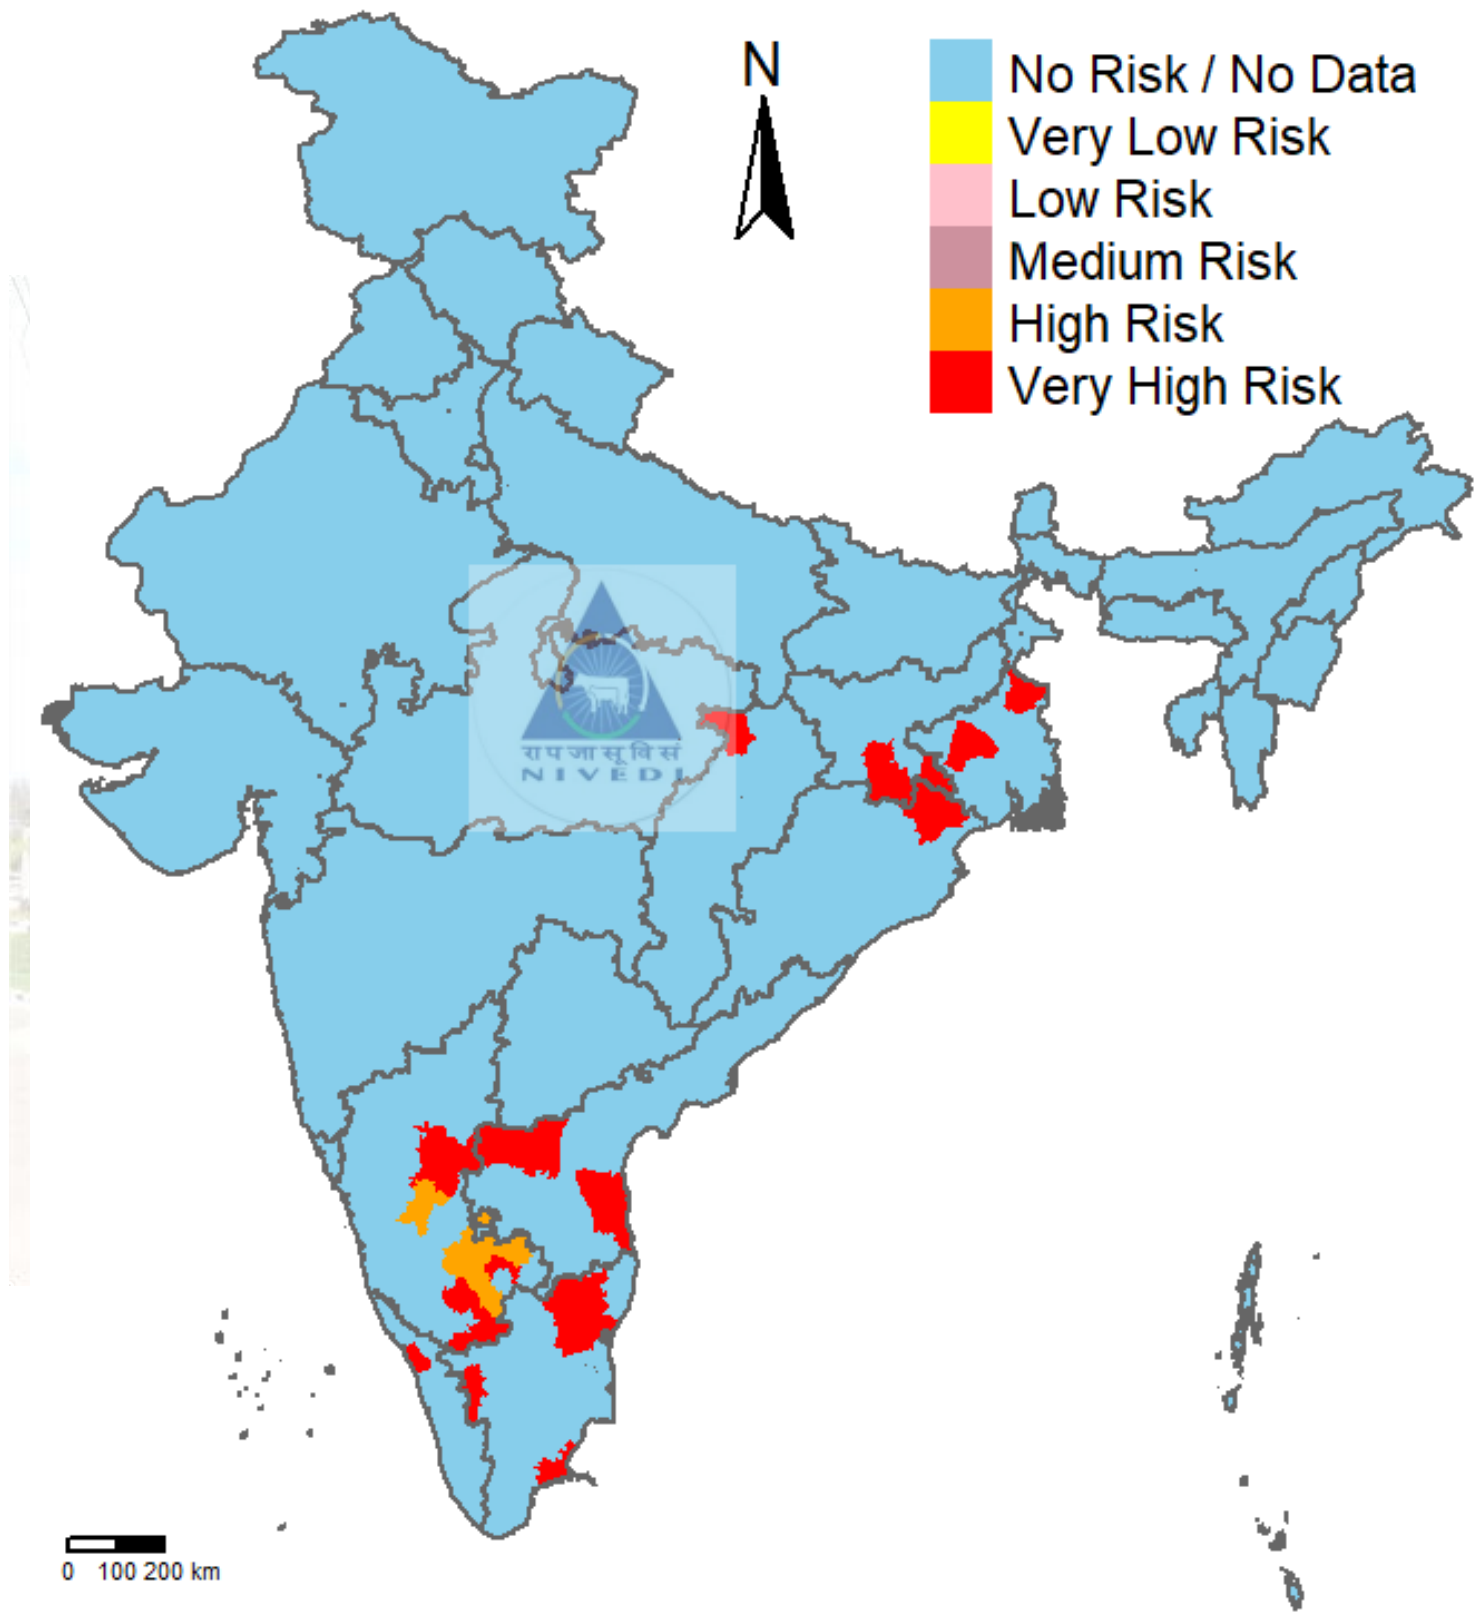

7.	Foot and Mouth Disease (FMD)	Cattle, buffalo, sheep, goats and pigs are often affected domesticated species, but the disease is more severe in cattle and pigs.	Fever, loss of feed intake, drop in milk production, drooling of saliva like ropey string, vesicles develop on the tongue, lips, gums, and palate and eventually rupture. Concurrent to oral lesions, vesicles also appear in inter digital skin and coronary band of the feet. The animal may open and close its mouth with a characteristic smacking sound. Sheep and goats may show lameness. In pigs, lesions may be seen on snout and also on the feet.	Regular vaccination and seromonitoring. Disinfection with sodium carbonate (4%) or 10% washing soda and strict biosecurity measures to be followed and animal movement may be controlled.
8.	Haemorrhagic septicaemia (HS)	Common disease for cattle and buffaloes, but can also occur among other species such as pigs, sheep, goats and many wild animals.	The disease starts with high fever, respiratory distress and haemorrhages maybe seen on the mucous membranes. There is lacrymation, nasal discharge, drop in milk production and anorexia. As the disease progress ear droops and the	Affected animals may be treated with suitable antibiotics. Vaccination to be done in consultation with the veterinarians and as decided by state animal husbandry authorities. Strict biosecurity measures may be followed. Carcass may be disposed hygienically and stress factors may be reduced by following good animal husbandry practices.

			<p>animals will be prostrated with cyanosis of mucous membranes.</p> <p>There may be oedema along the head, neck, thorax, vulva and anal areas.</p> <p>Sudden death occurs within few hours of clinical signs.</p>	
9.	Pest des Petits Ruminants (PPR)	Goats and sheep are most affected domestic animals.	<p>Fever, nasal and ocular discharge, respiratory distress, necrotic lesions in buccal mucosa, gum, dental pad, palate, tongue and diarrhoea.</p> <p>Animals may die because of dehydration and pneumonia.</p>	Vaccination of susceptible animals of above 3 months old age. Restriction on animal movement, strict biosecurity measures and proper disposal of carcass.
10.	Sheep and Goat pox (SGP)	Sheep and Goats	<p>Respiratory distress and pock lesions over the non-hairy parts of body, more common in teat, udder, scrotum, head, neck, ear, perineum, inner aspect of thighs and under tail.</p>	Vaccination of susceptible animals of above 3 months old age. Symptomatic treatment of affected animals. Restriction on animal movement, strict biosecurity measures and proper disposal of carcass.

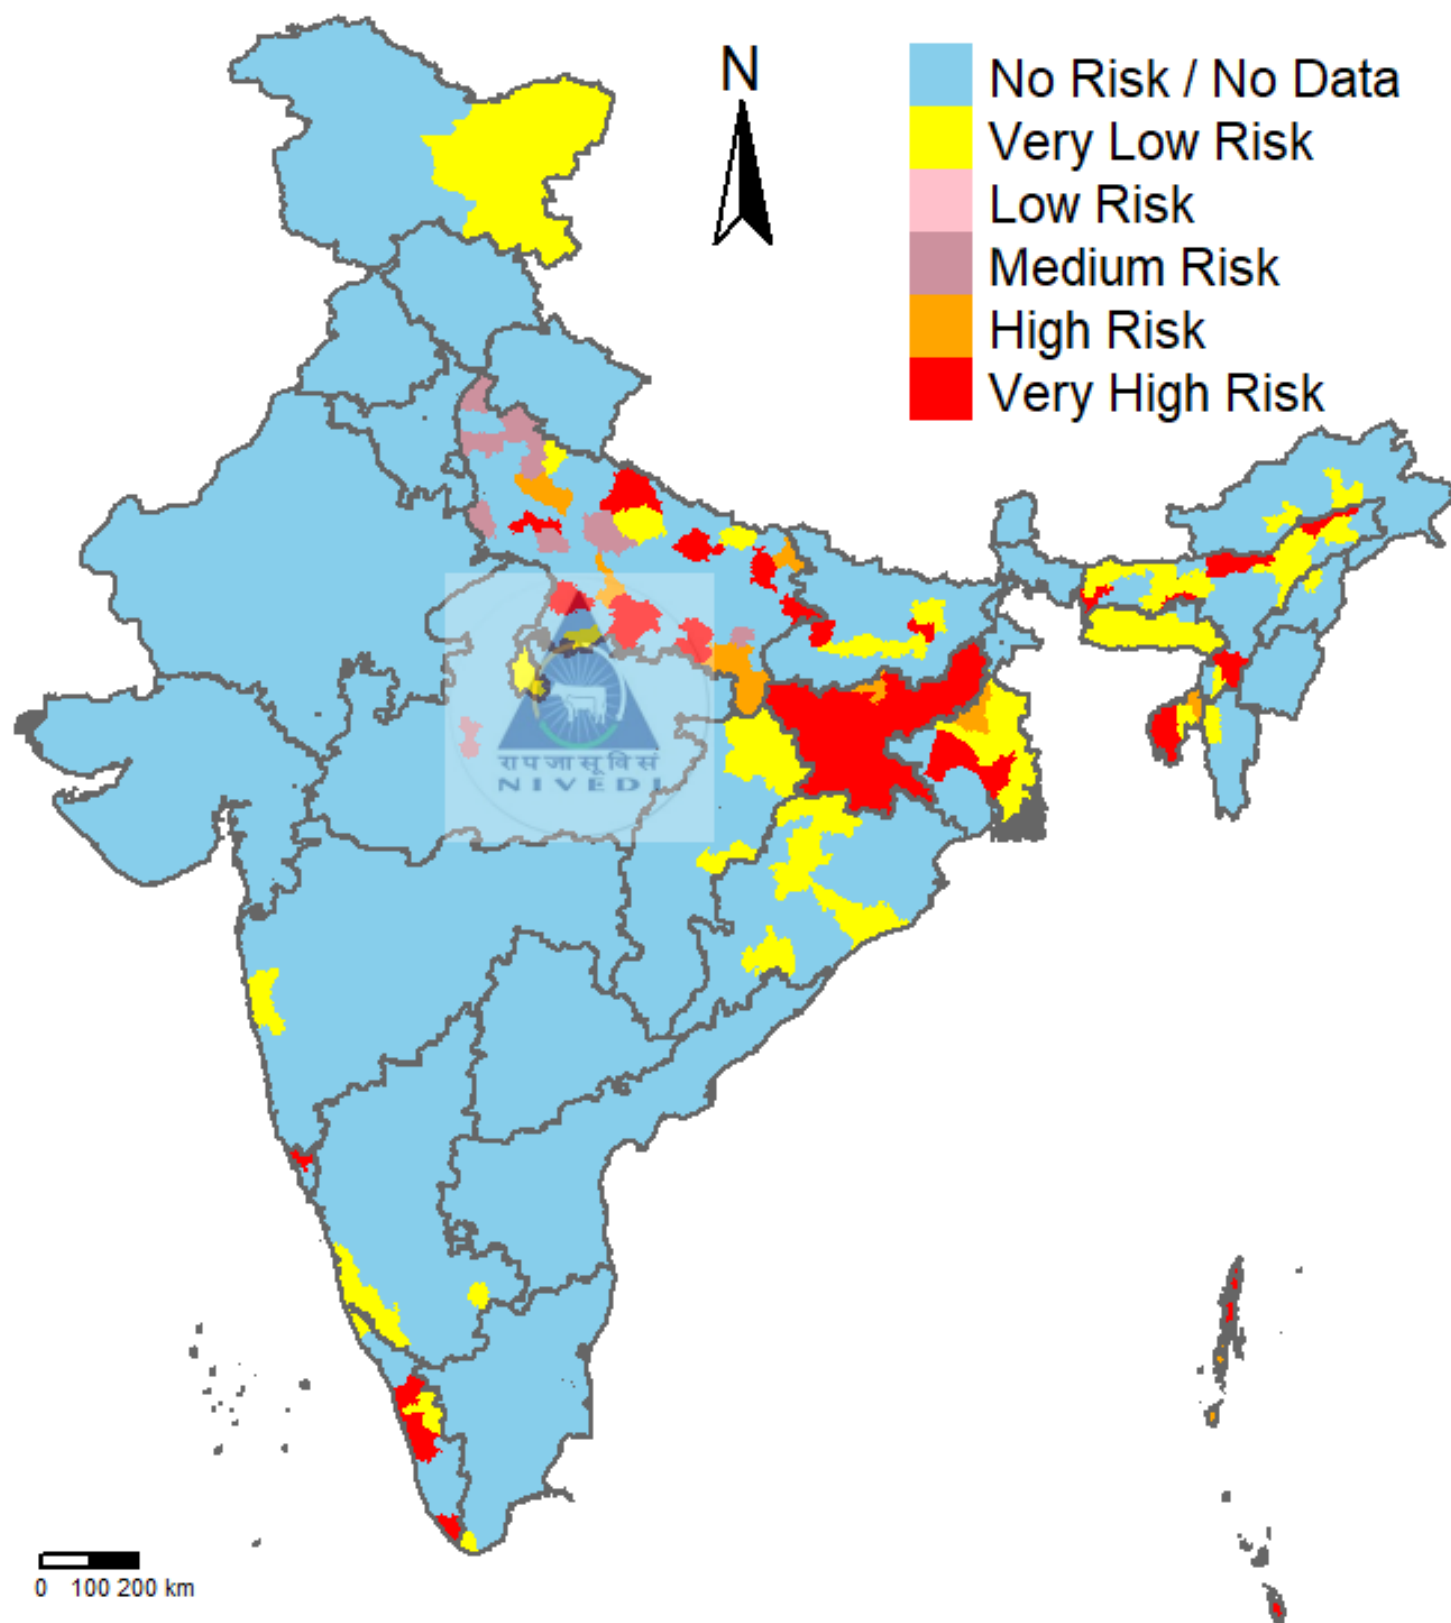

11.	Classical Swine Fever (CSF)	Pigs	Fever, Conjunctivitis, purplish discolouration of snout, ears, abdomen, inner side of the legs and staggering gait.	Vaccination of susceptible animals. Restriction on animal movement, strict biosecurity measures and proper disposal of carcass.
12.	Theileriosis (TE)	Large Ruminants. Cross bred cattle are more vulnerable.	High temperature, yellowish eye, sometime eyes may be heavily swollen, icteric mucosal membrane of rectum, dark yellowish urine, sometime may reach to coffee colour. Antibiotic is of no use to check the fever.	Periodical application of acaricides in and around the animal shed and on the animals. Therapeutic treatment with Buparvaquone can be useful in both early and advanced stages of the infection.
13.	Trypanosomosis (TR)	Domestic and wild carnivores and herbivores including cattle, buffalo, horse, donkey, camel, dog and cats. Buffaloes are known as carriers.	Fluctuating high fever which is not responded by antibiotics, swollen lymph gland, chronic emaciation and weakness, loss of appetite, gradual loss of production.	The affected animal should be treated with Diaminazine compounds or chloride and sulphate salts of Quinapyramine. Periodical spray of insecticide in and around animal shed to remove the flies.

iv). Risk Prediction - Livestock Disease Forewarning Maps

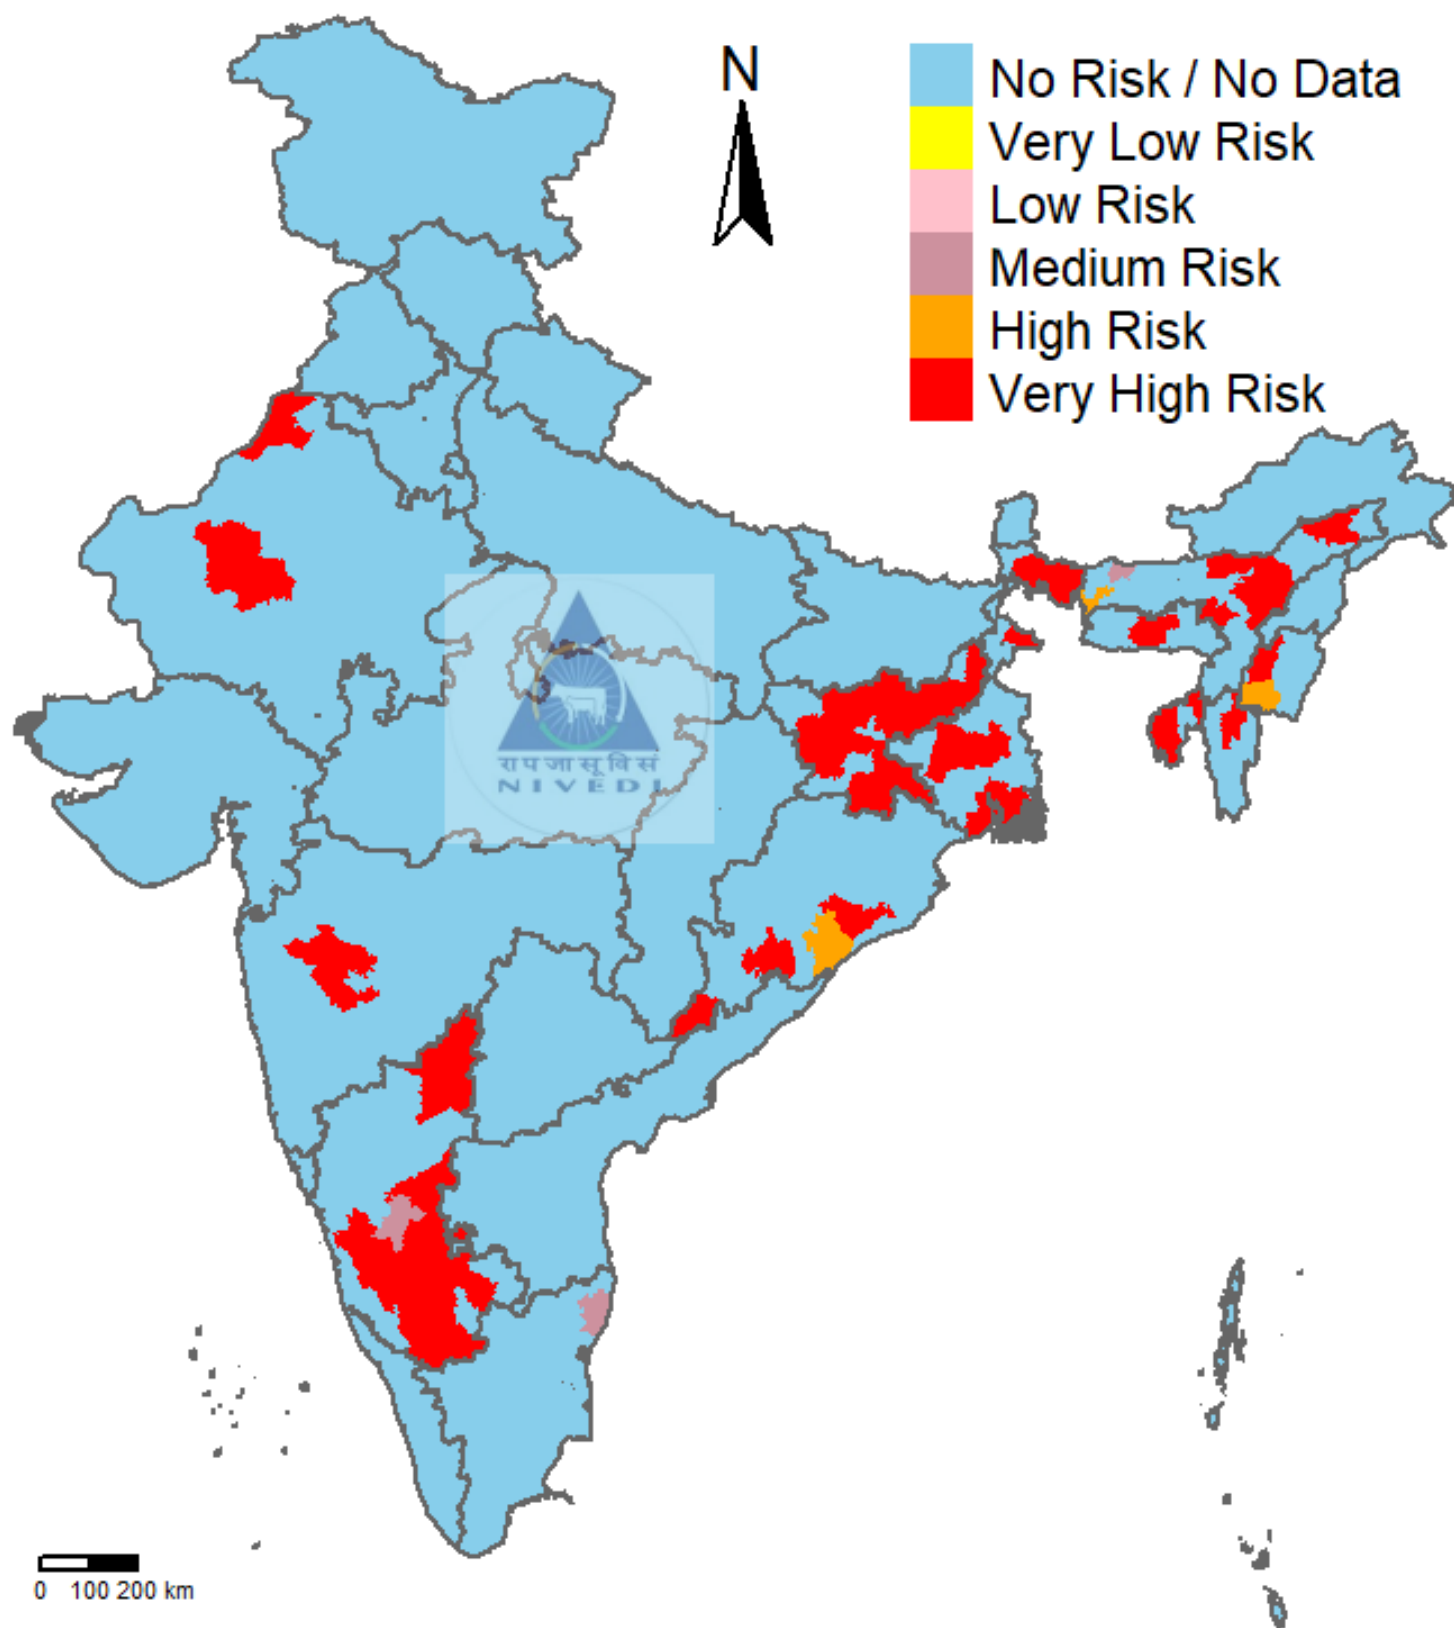

Risk Prediction of Anthrax for the month of December 2022

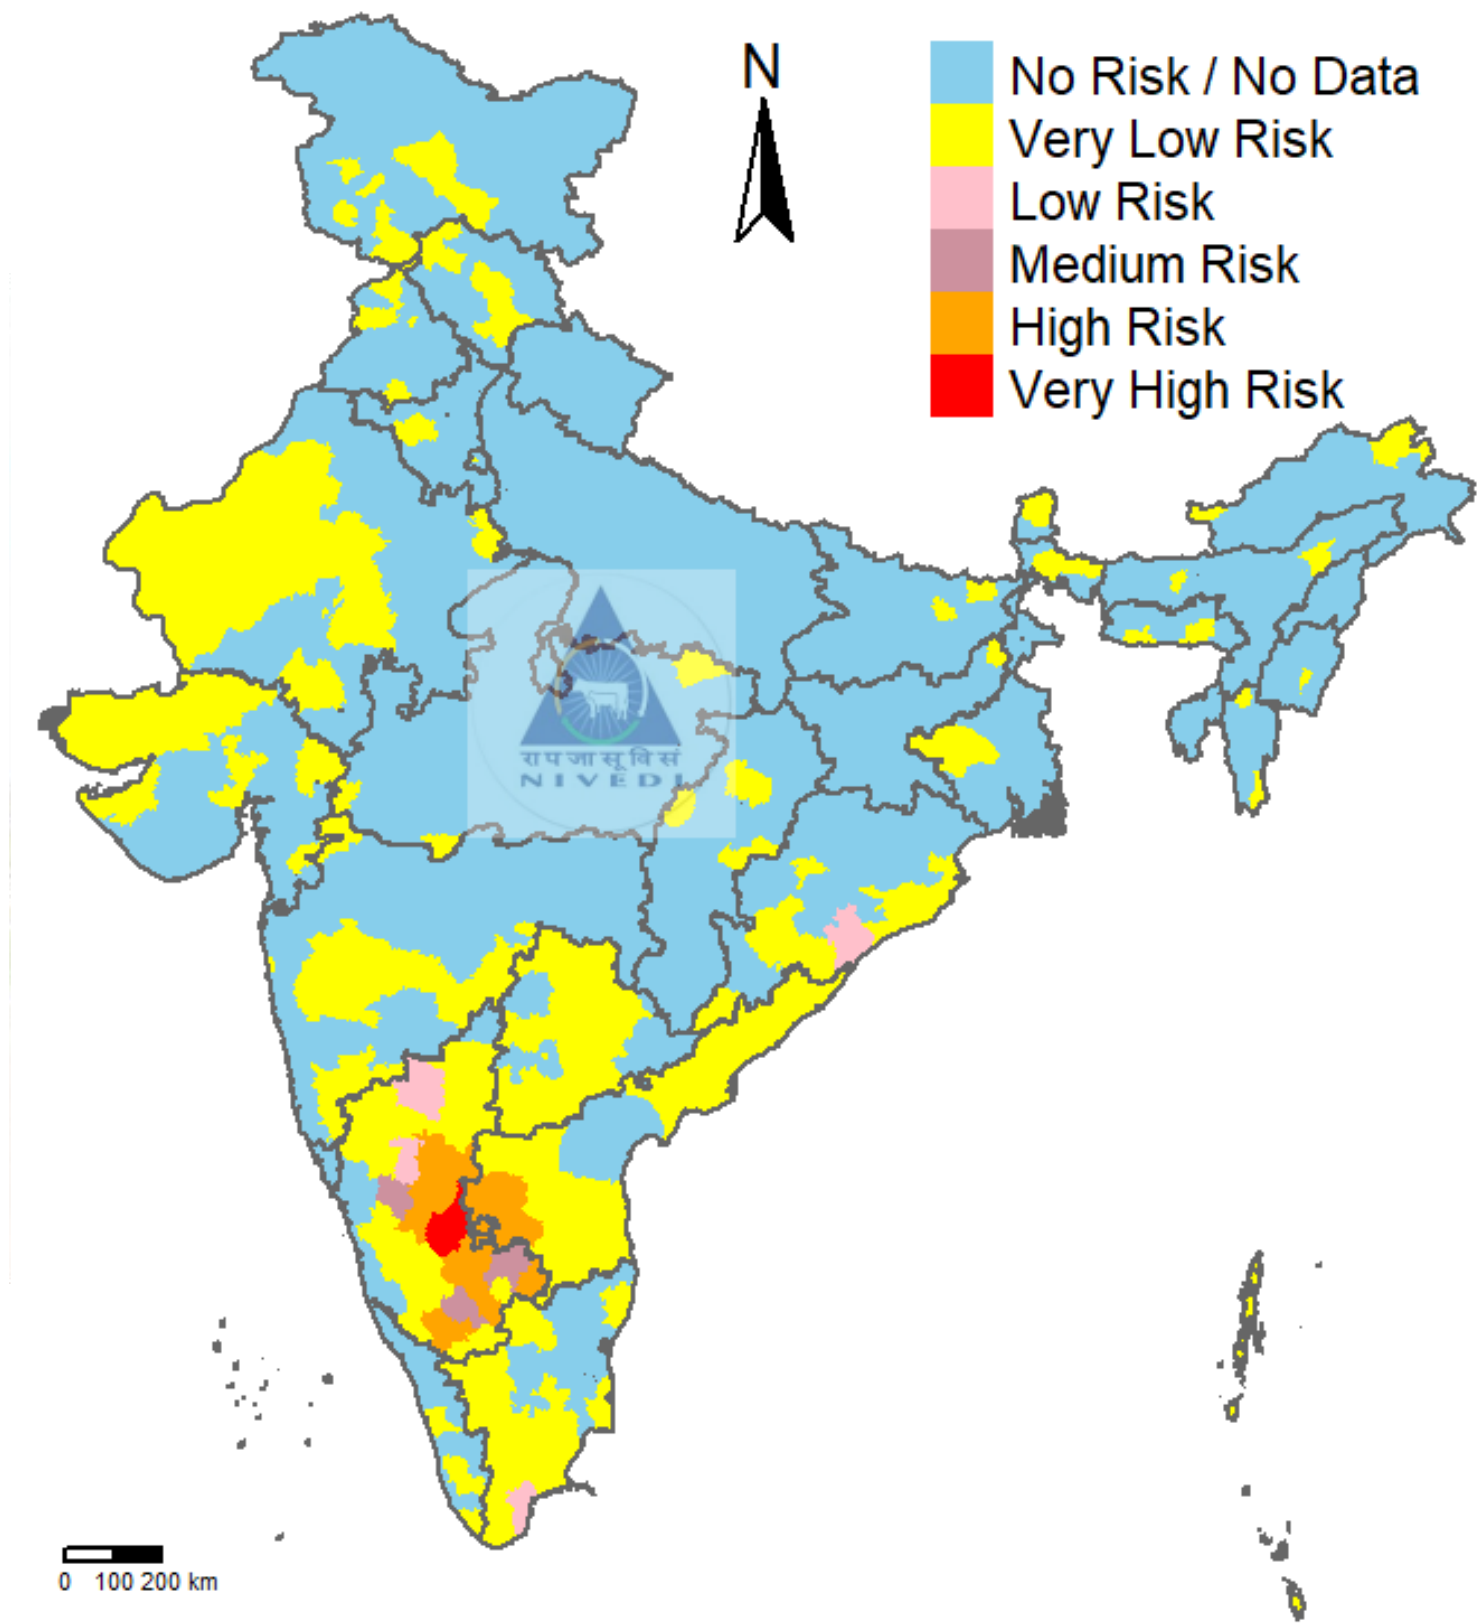

Risk Prediction of Babesiosis for the month of December 2022

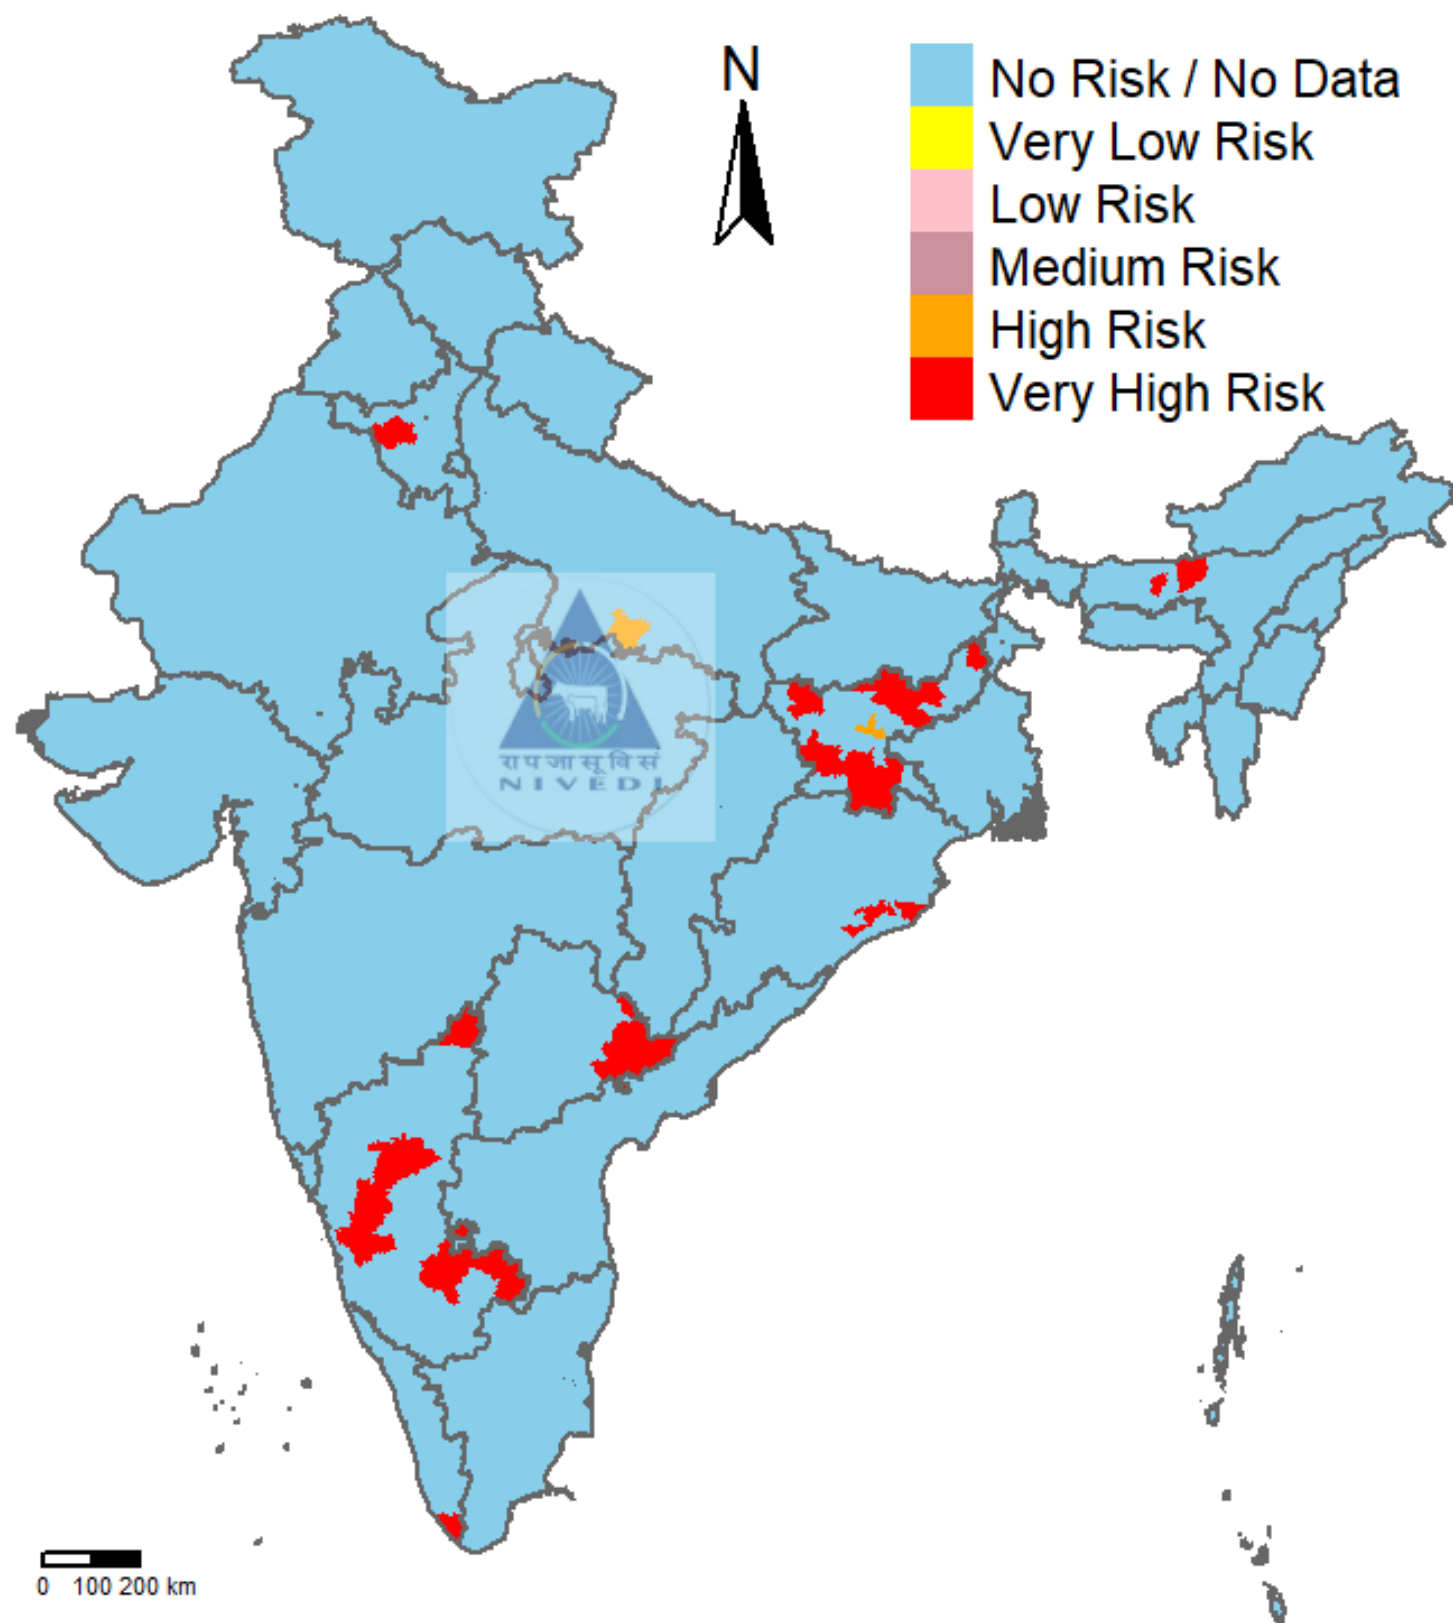

Risk Prediction of Black quarter for the month of December 2022

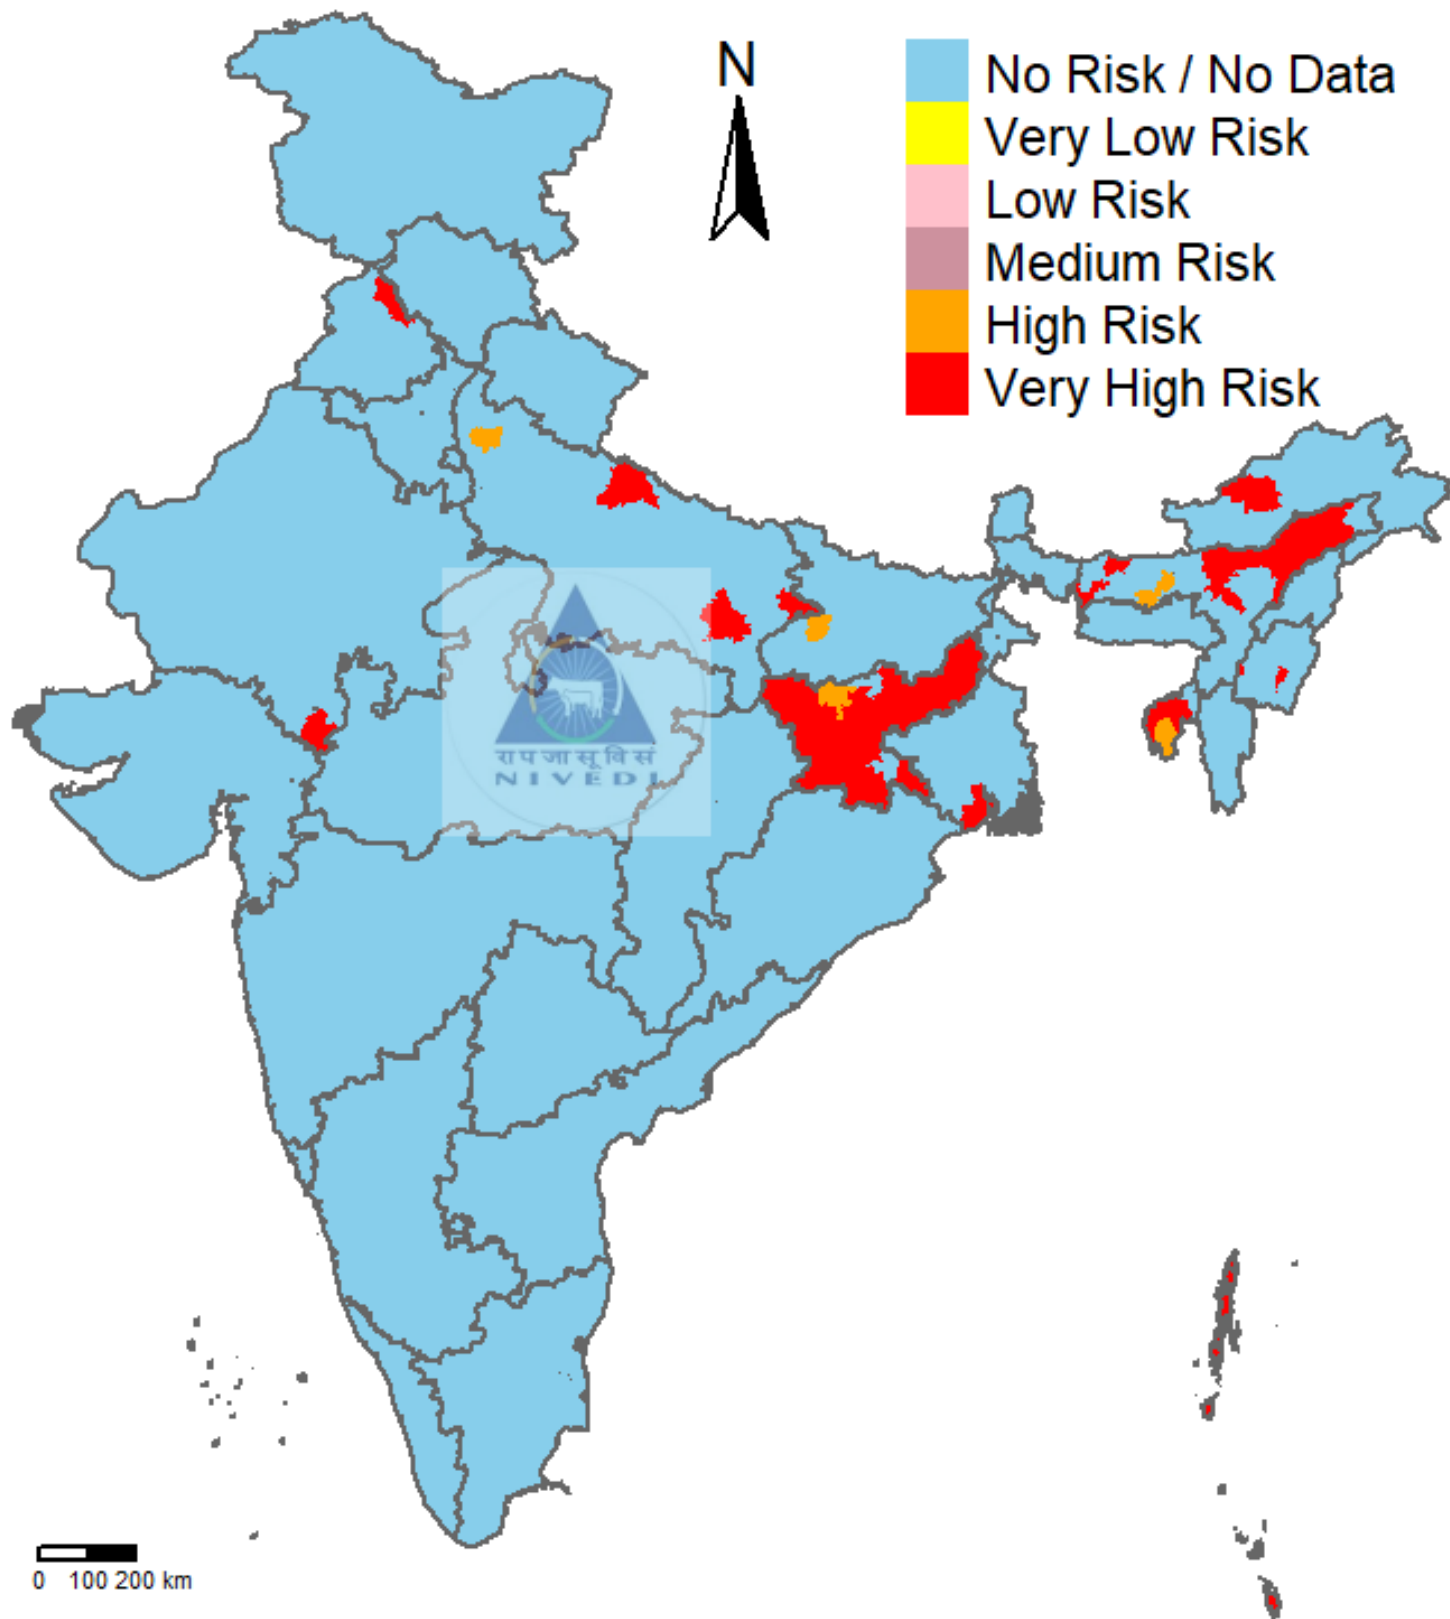

Risk Prediction of Bluetongue for the month of December 2022

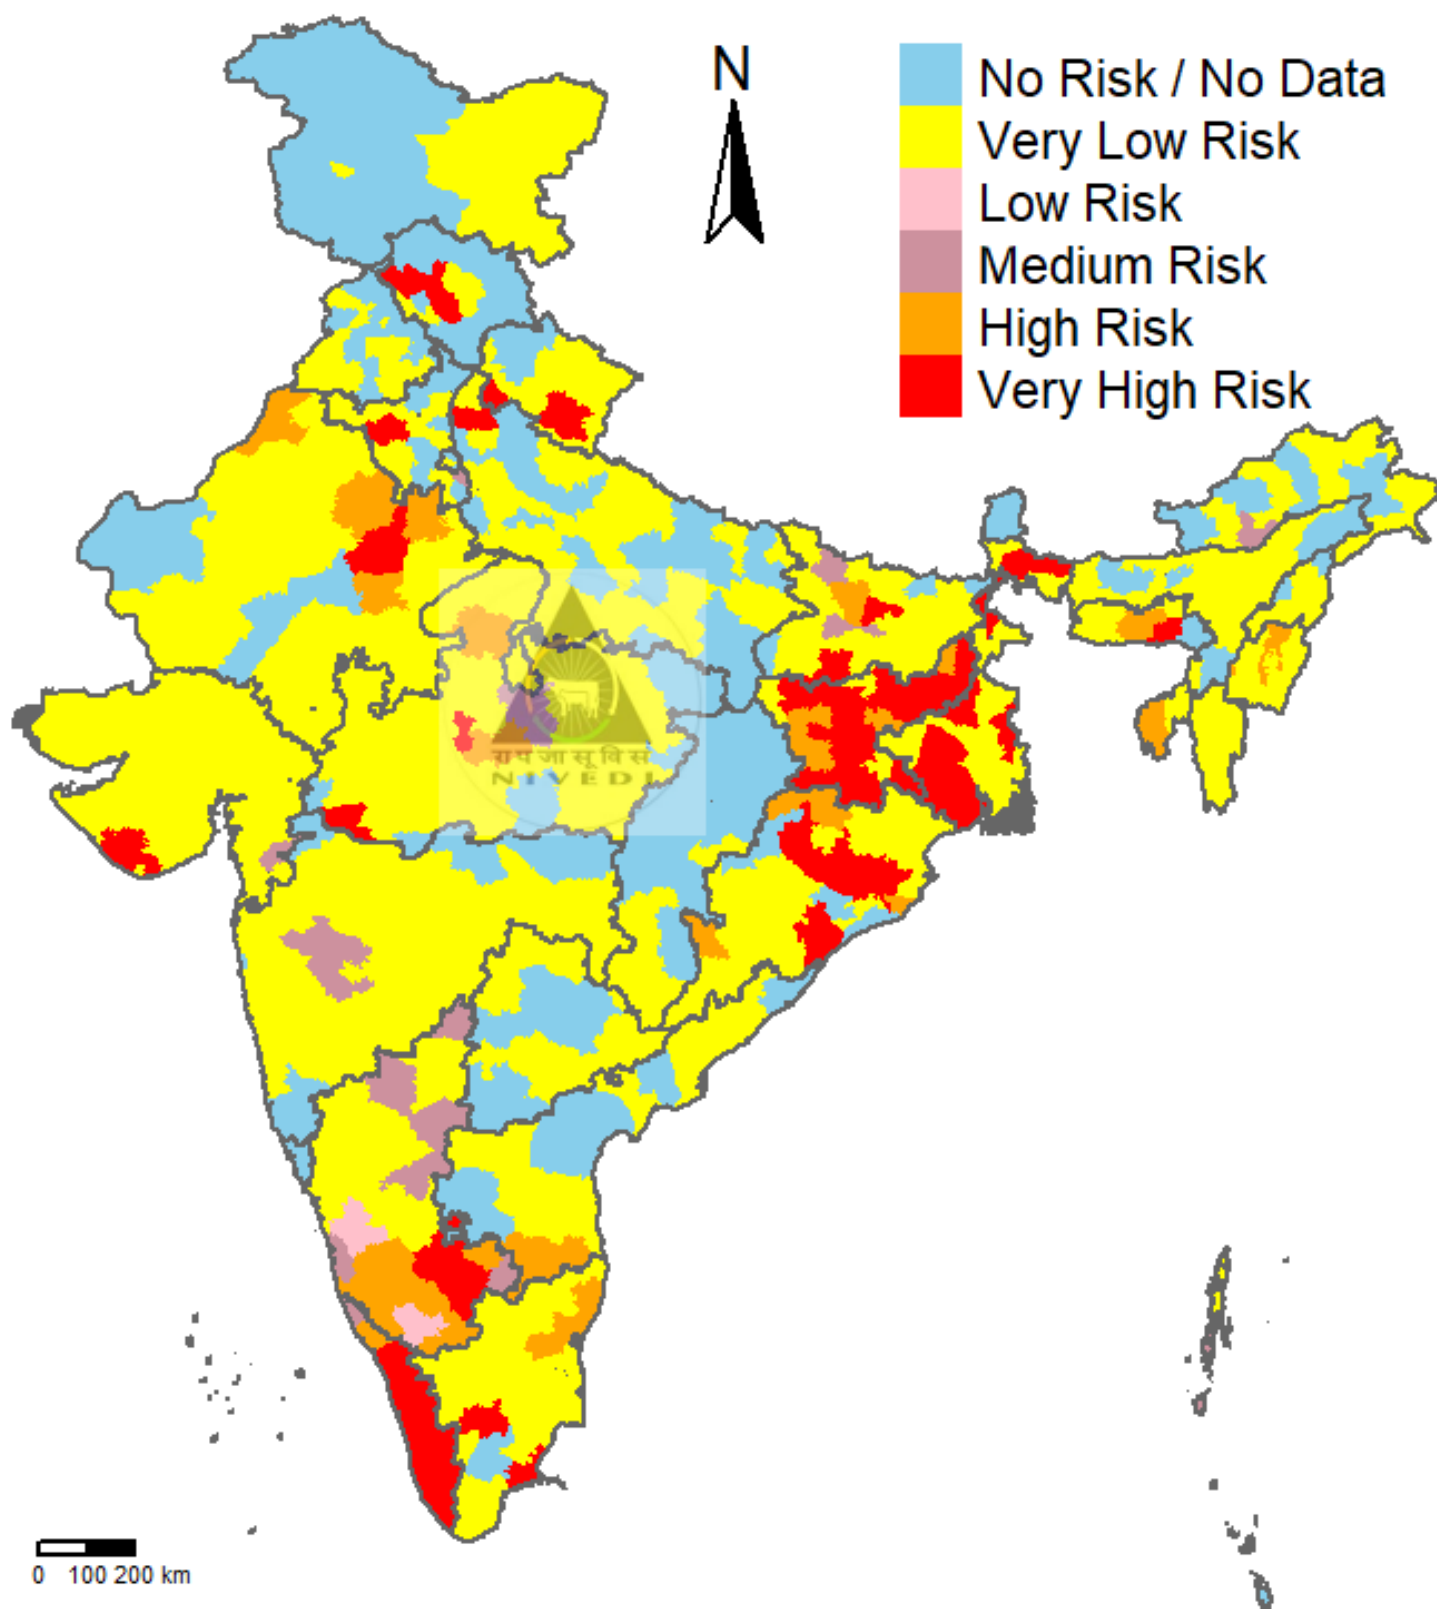

Risk Prediction of Enterotoxemia for the month of December 2022

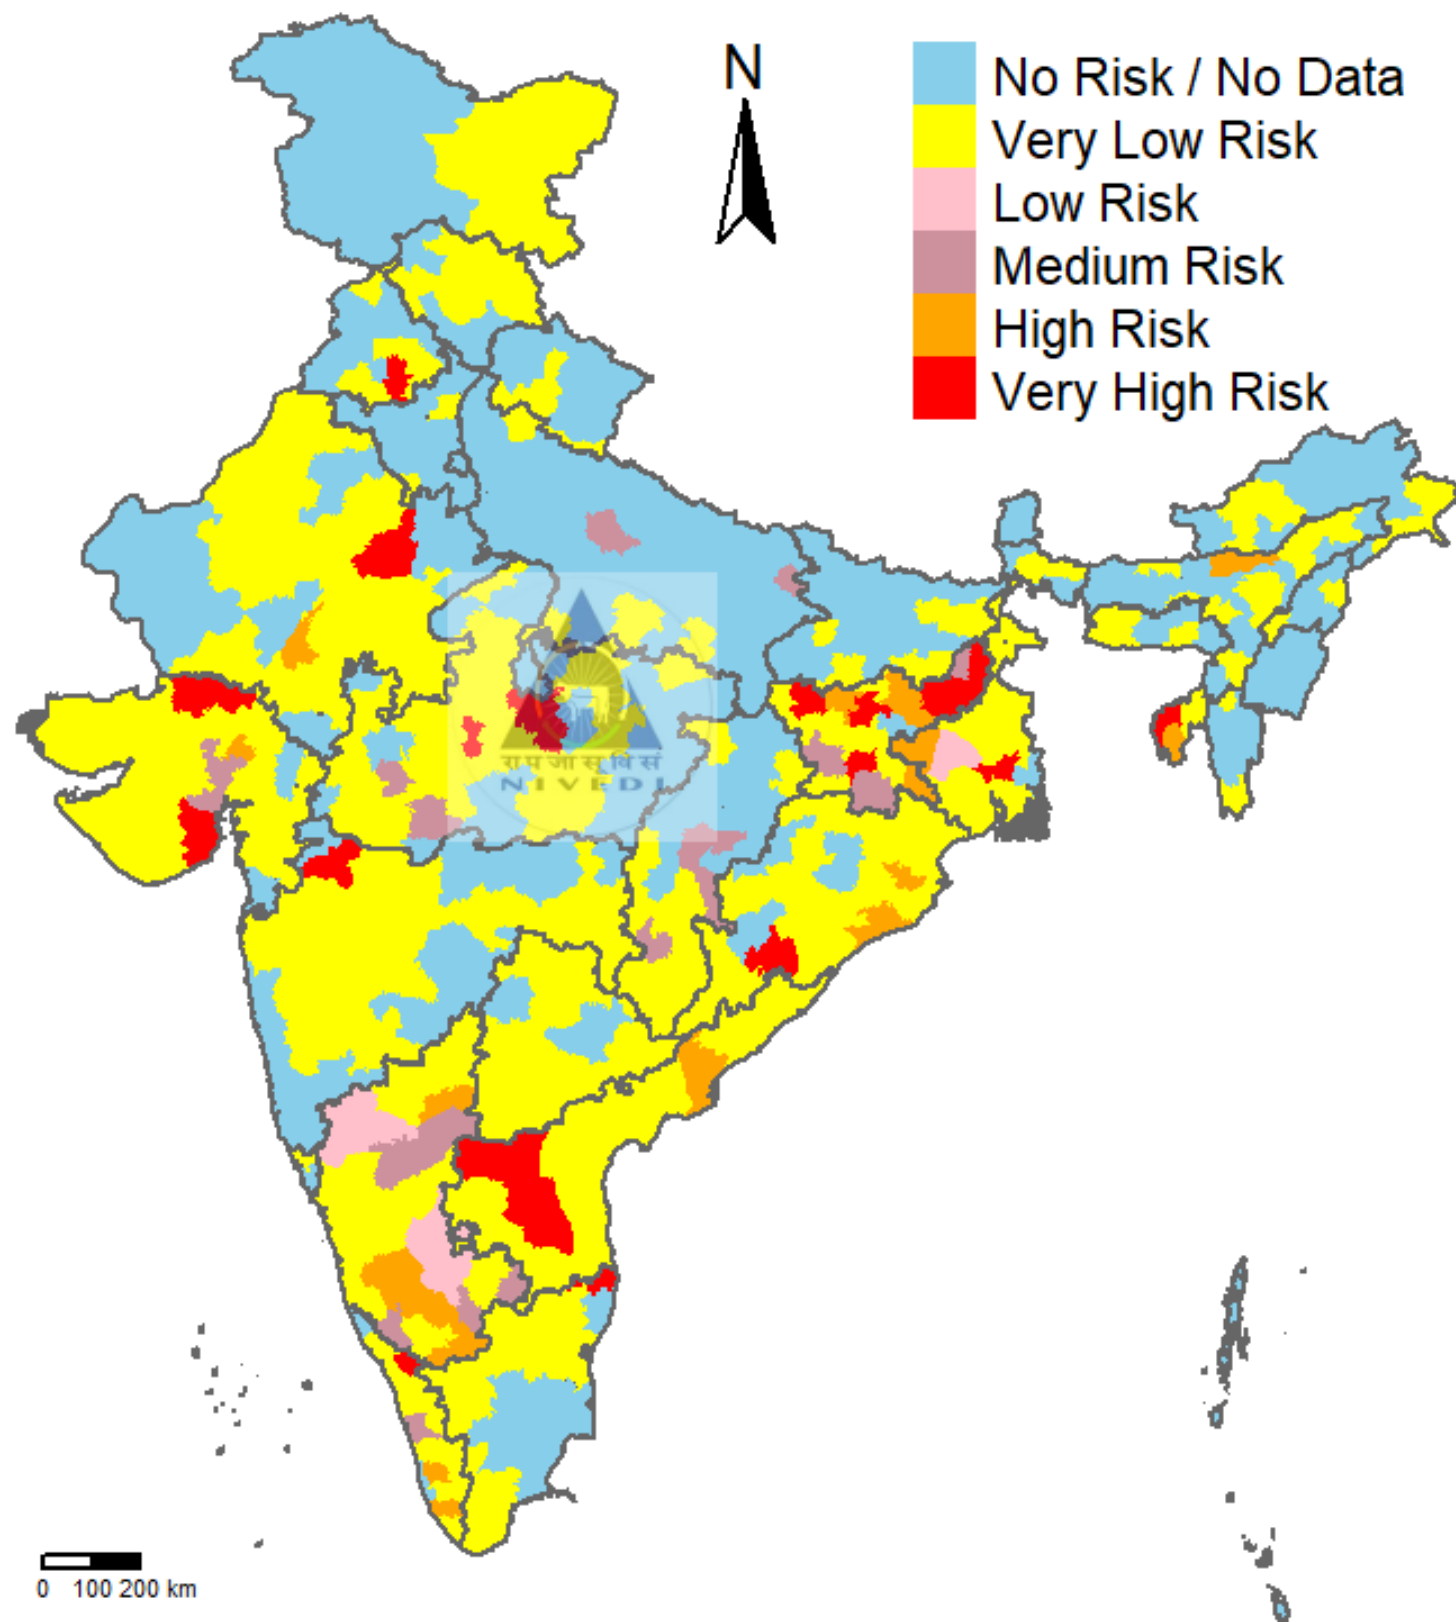

Risk Prediction of Fascioliasis for the month of December 2022

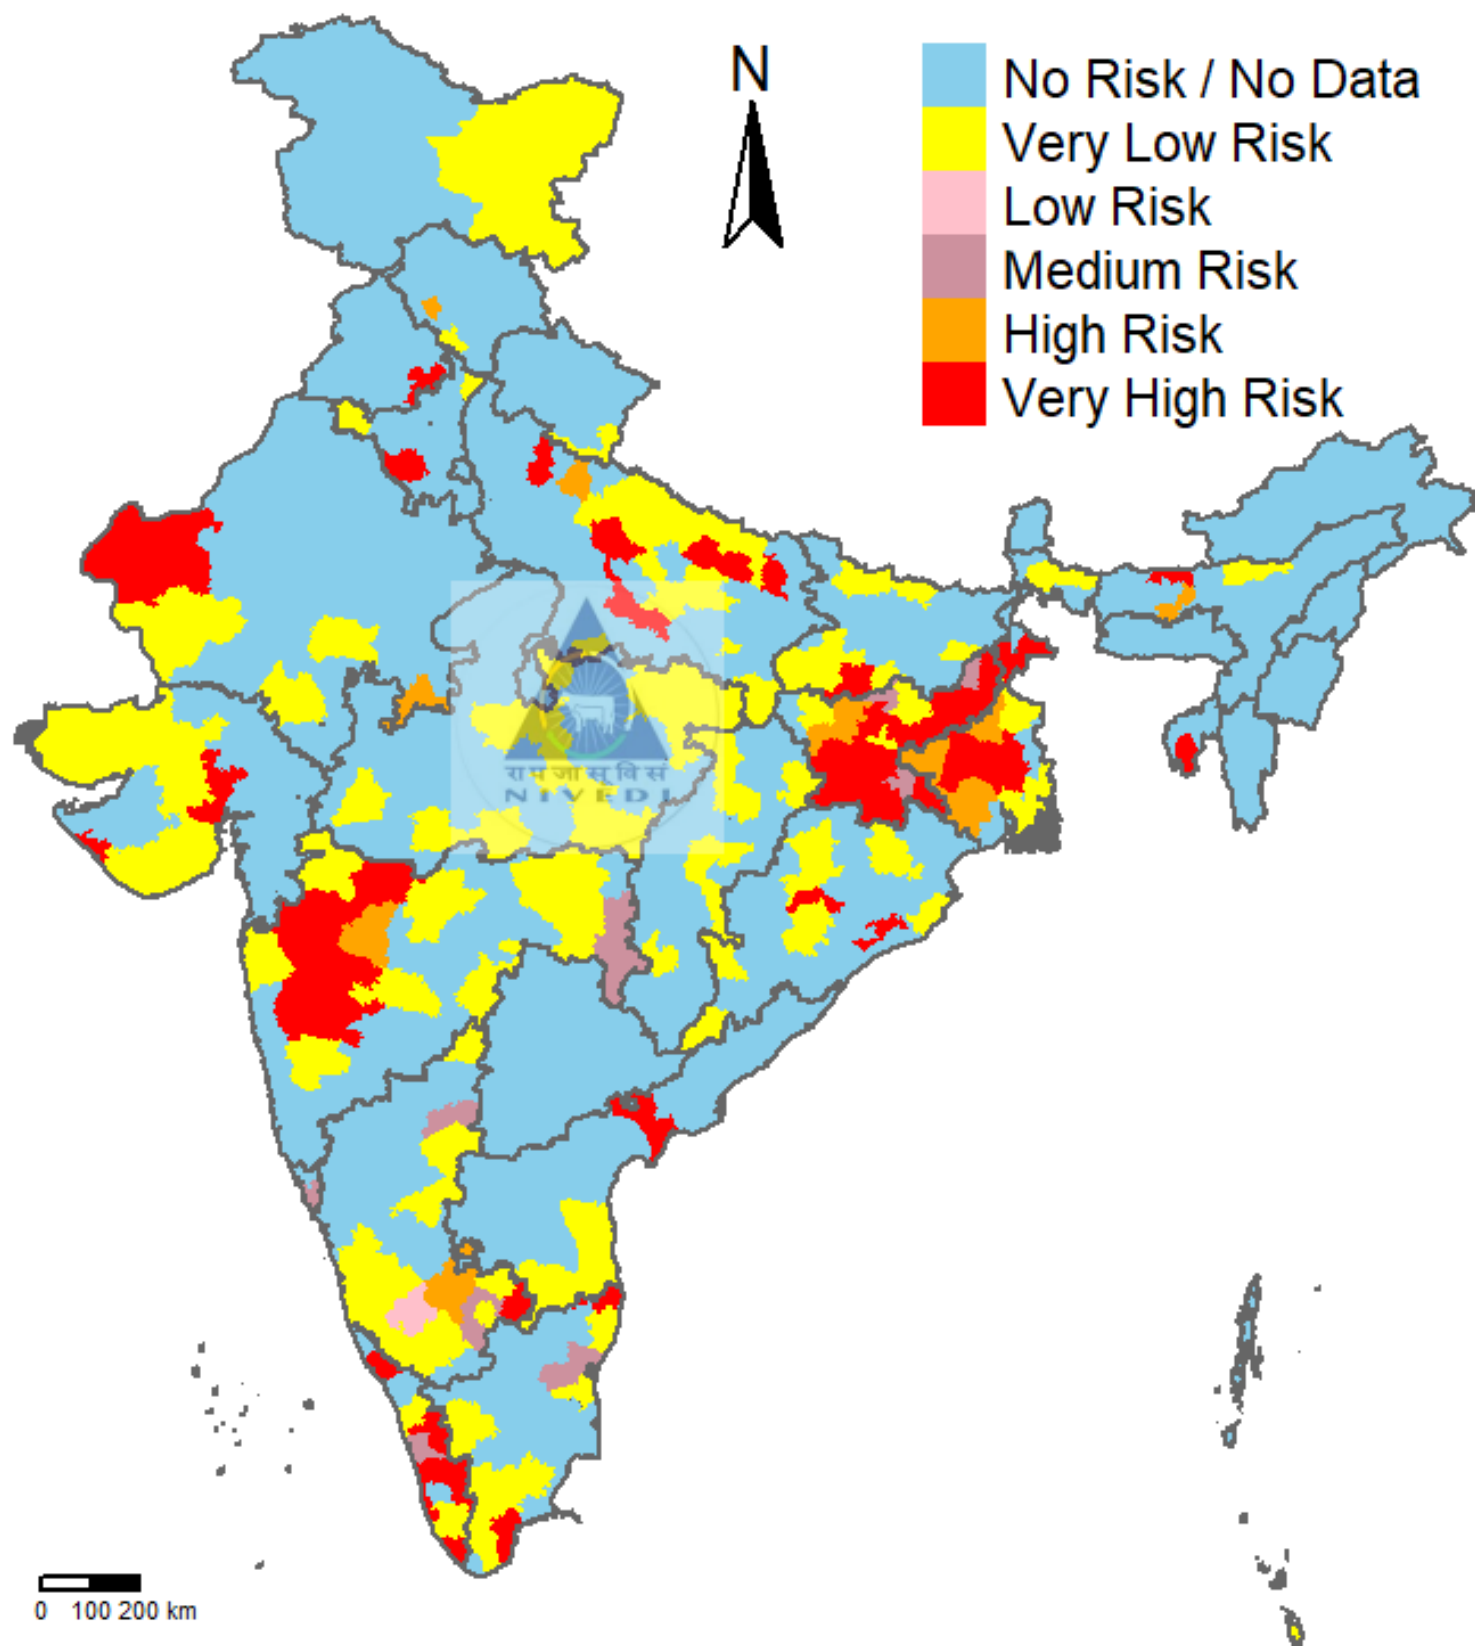

Risk Prediction of Foot and mouth disease for the month of December 2022

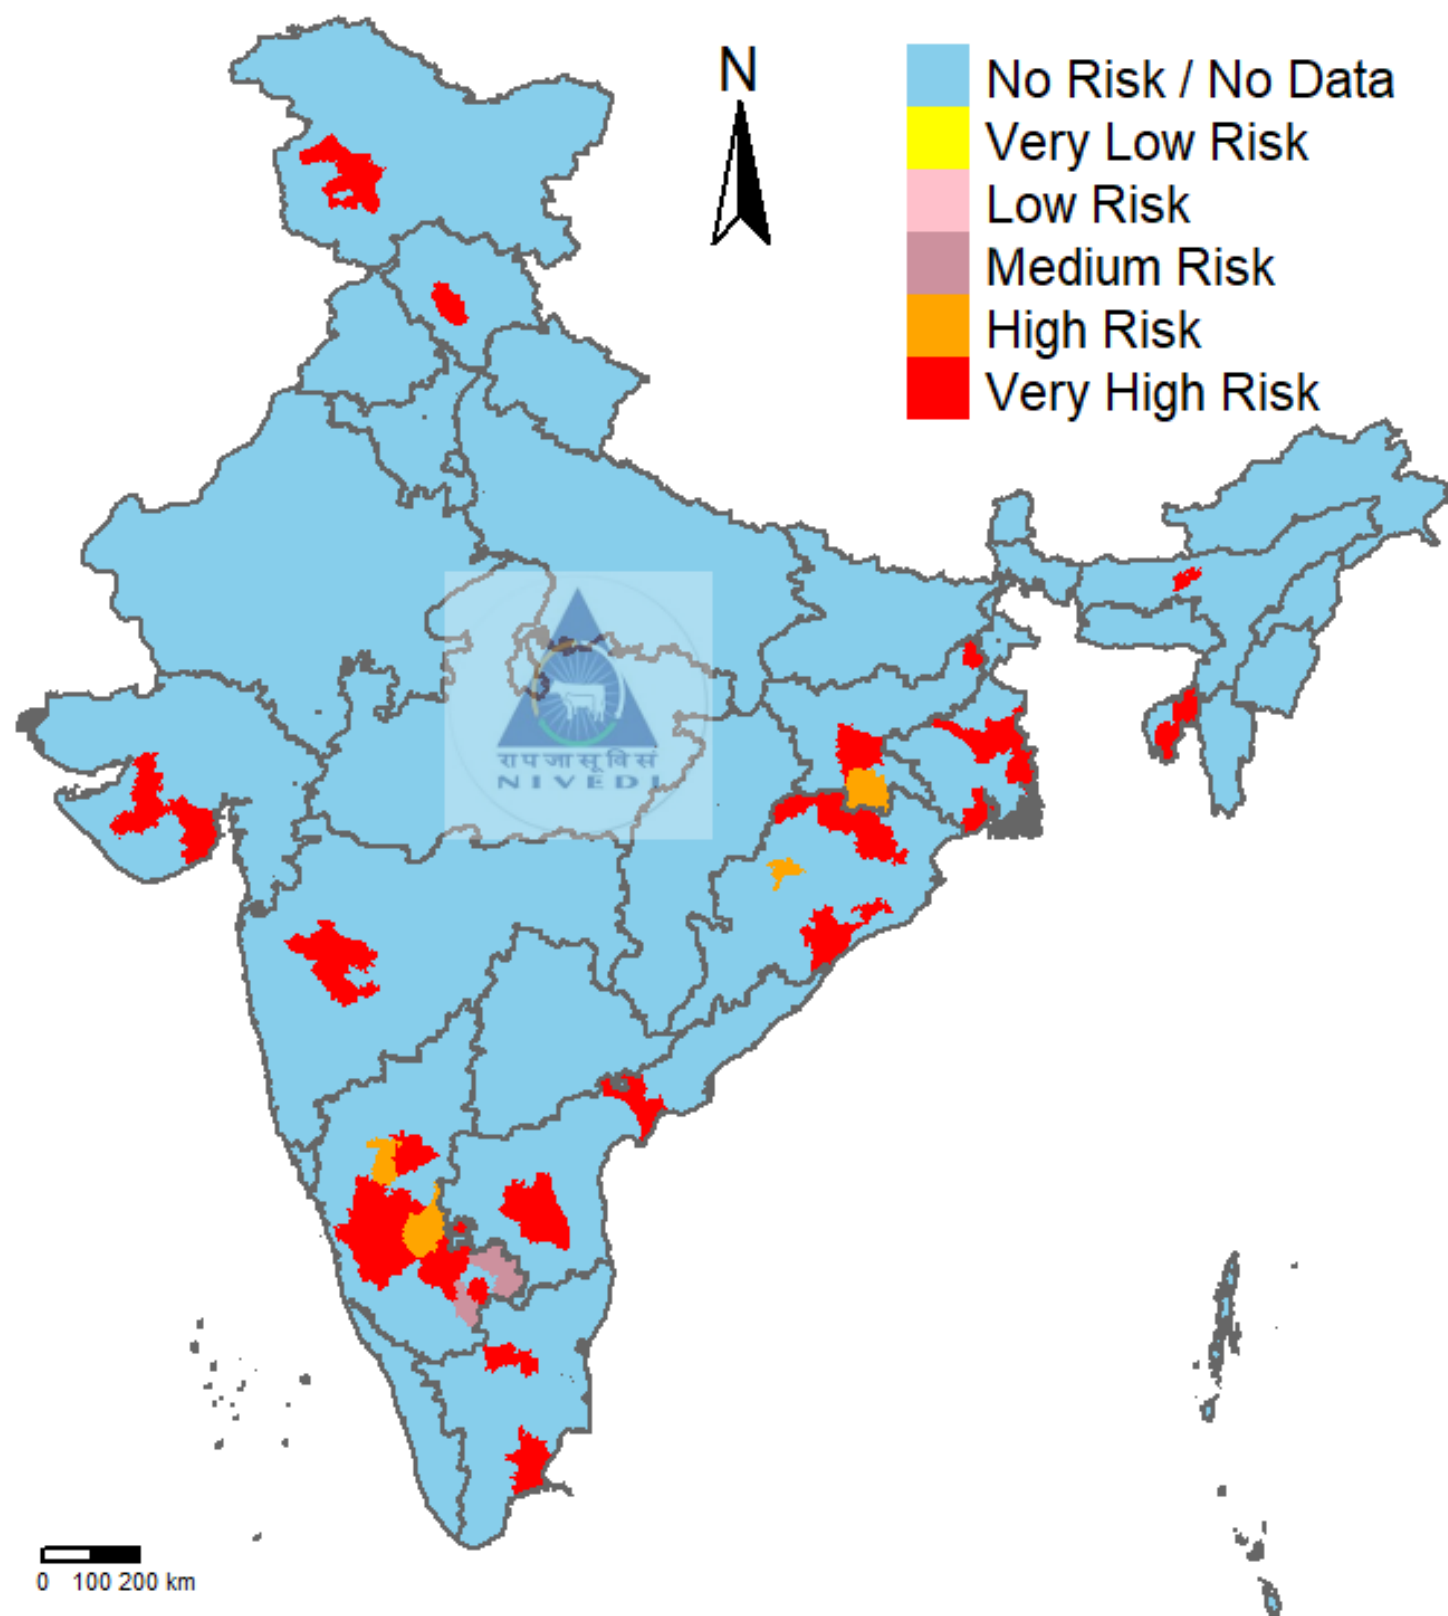

Risk Prediction of Haemorrhagic septicaemia for the month of December 2022

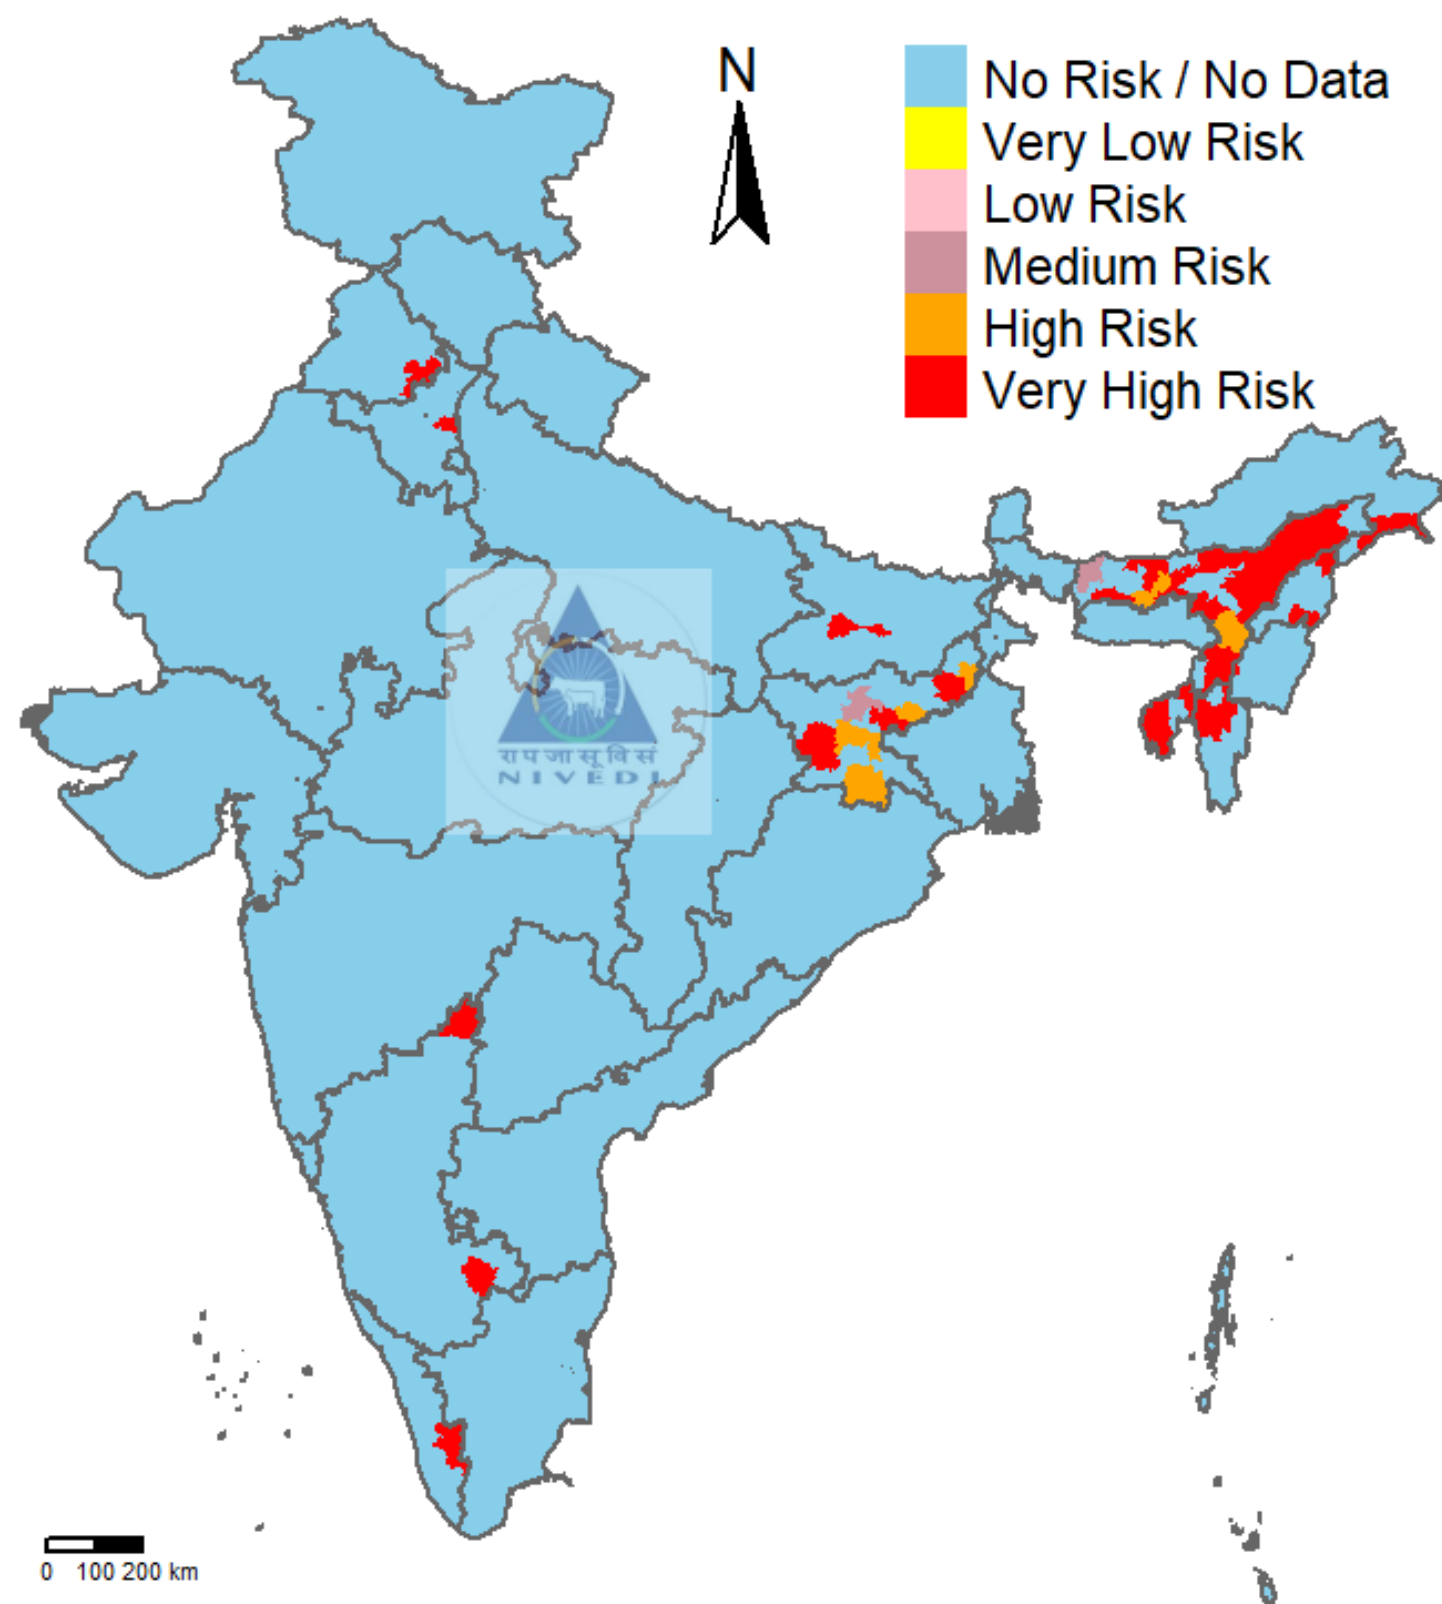

Risk Prediction of Peste des petits ruminants for the month of December 2022

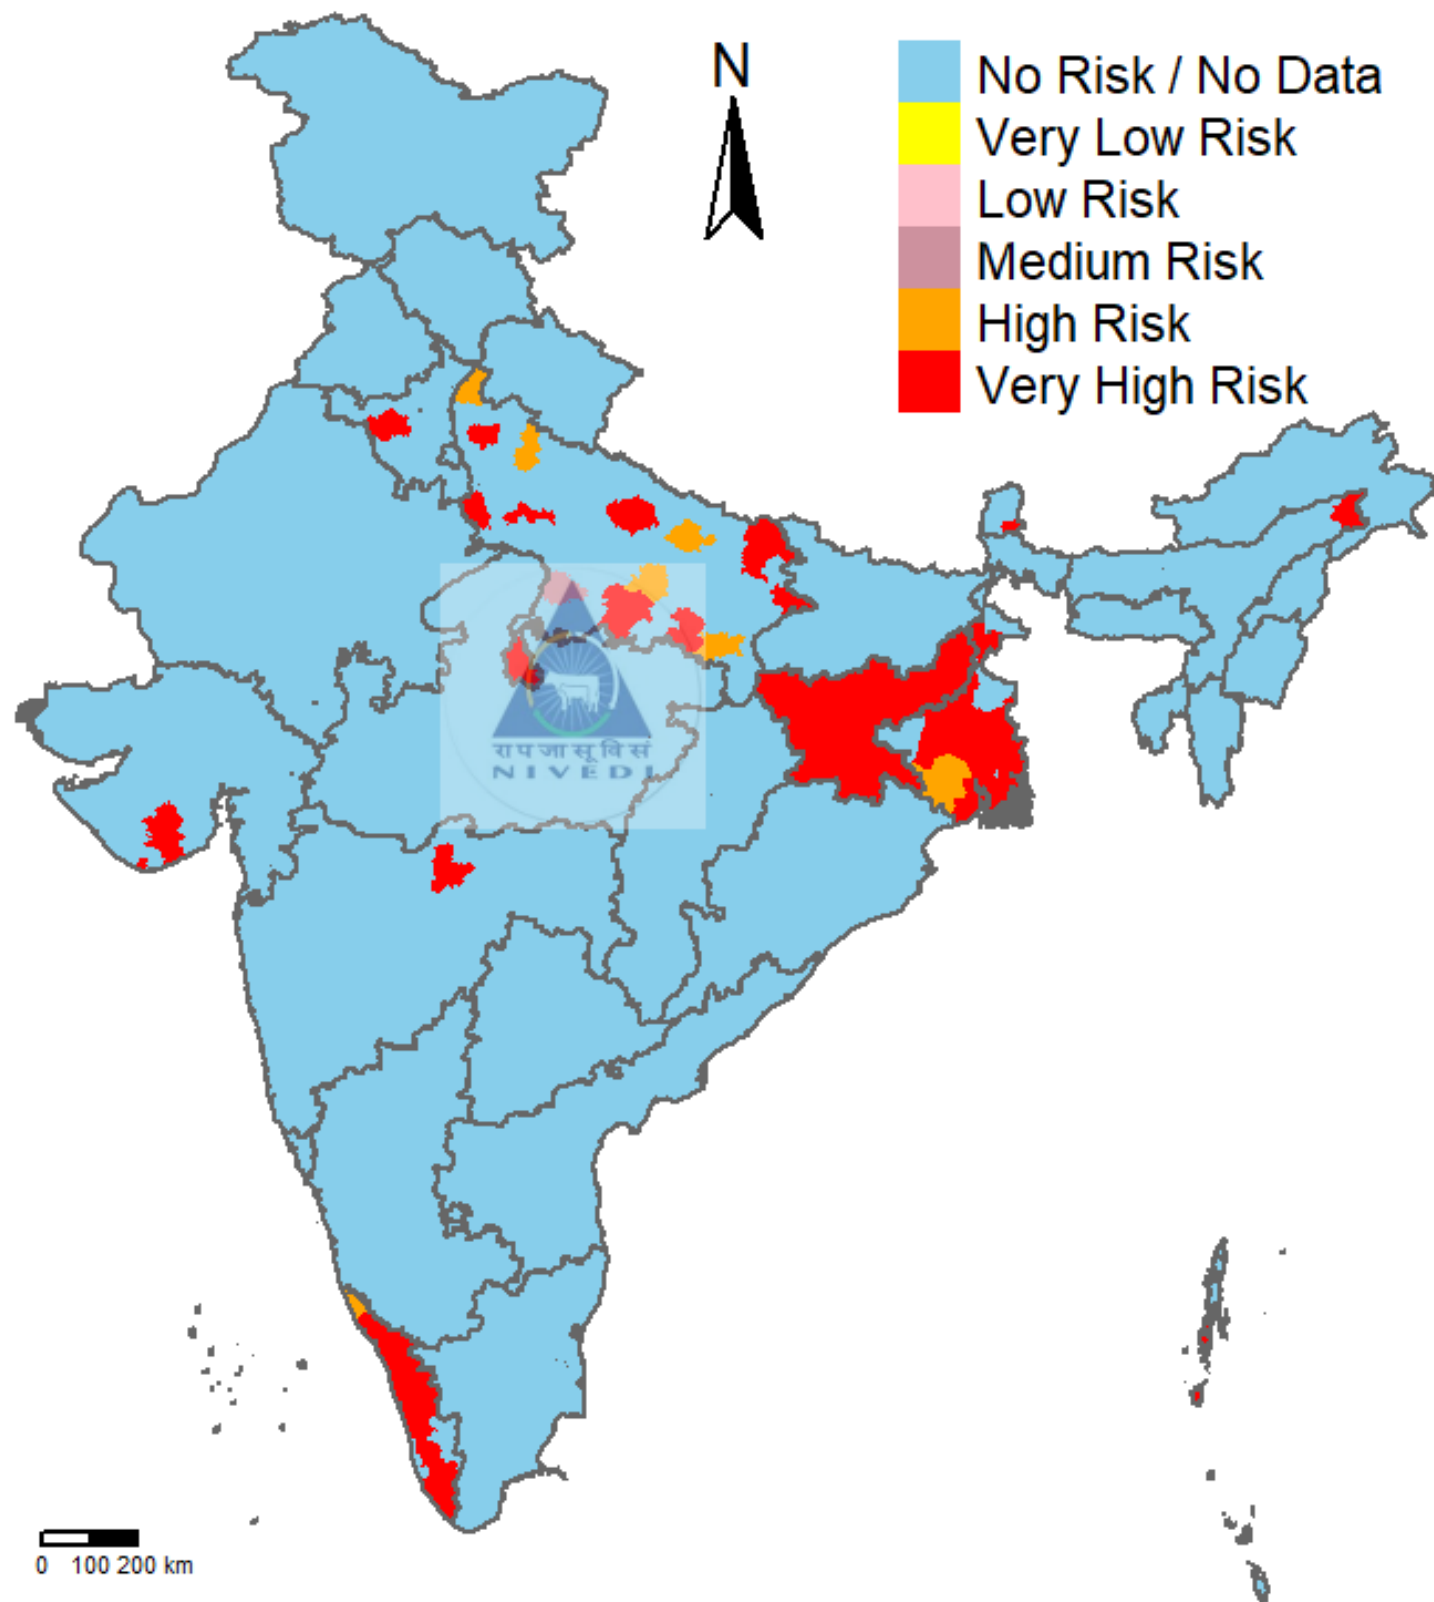

Risk Prediction of Sheep and Goat pox for the month of December 2022

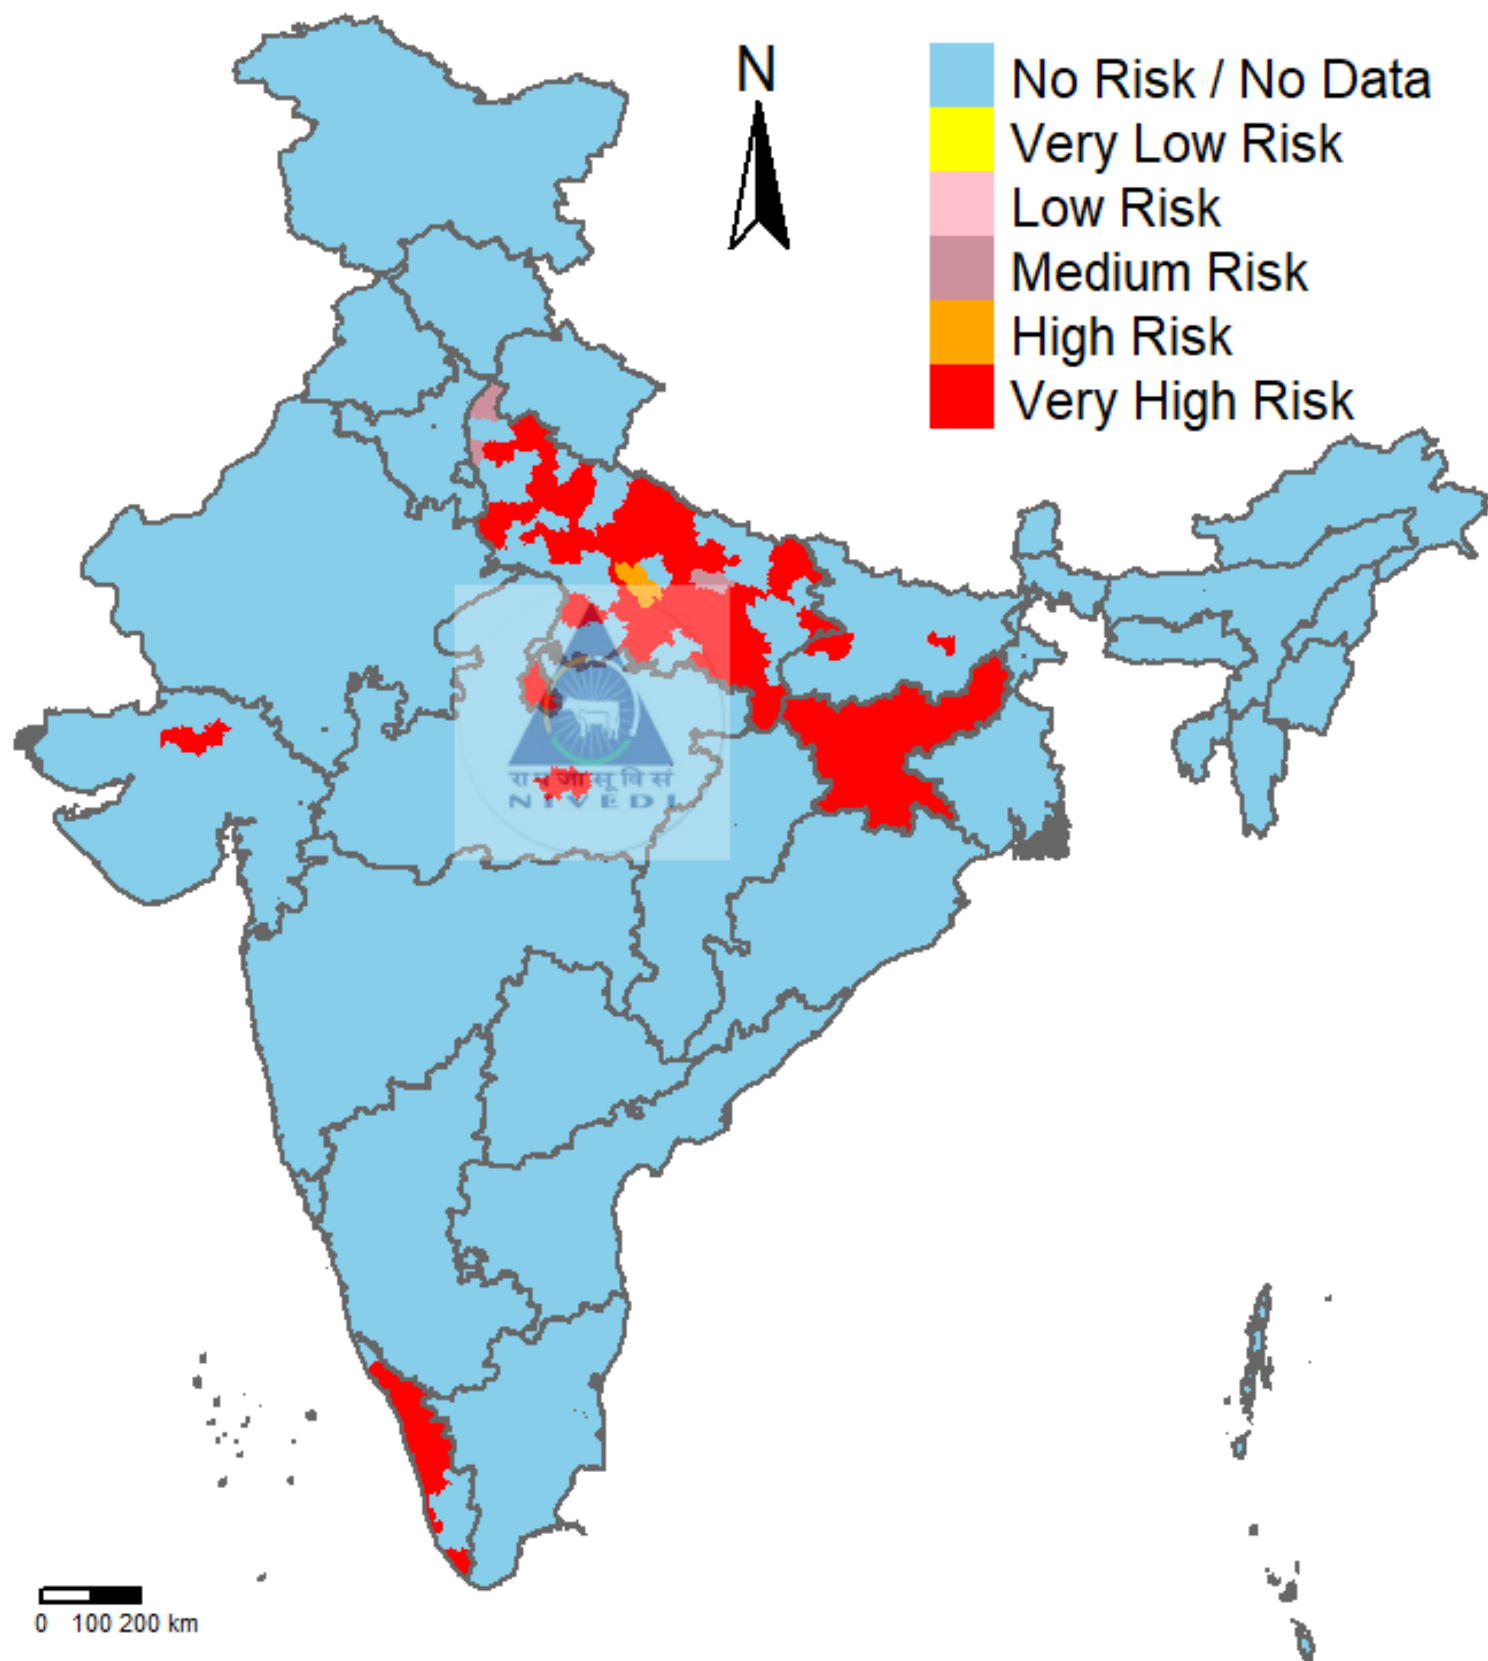

Risk Prediction of Swine fever for the month of December 2022

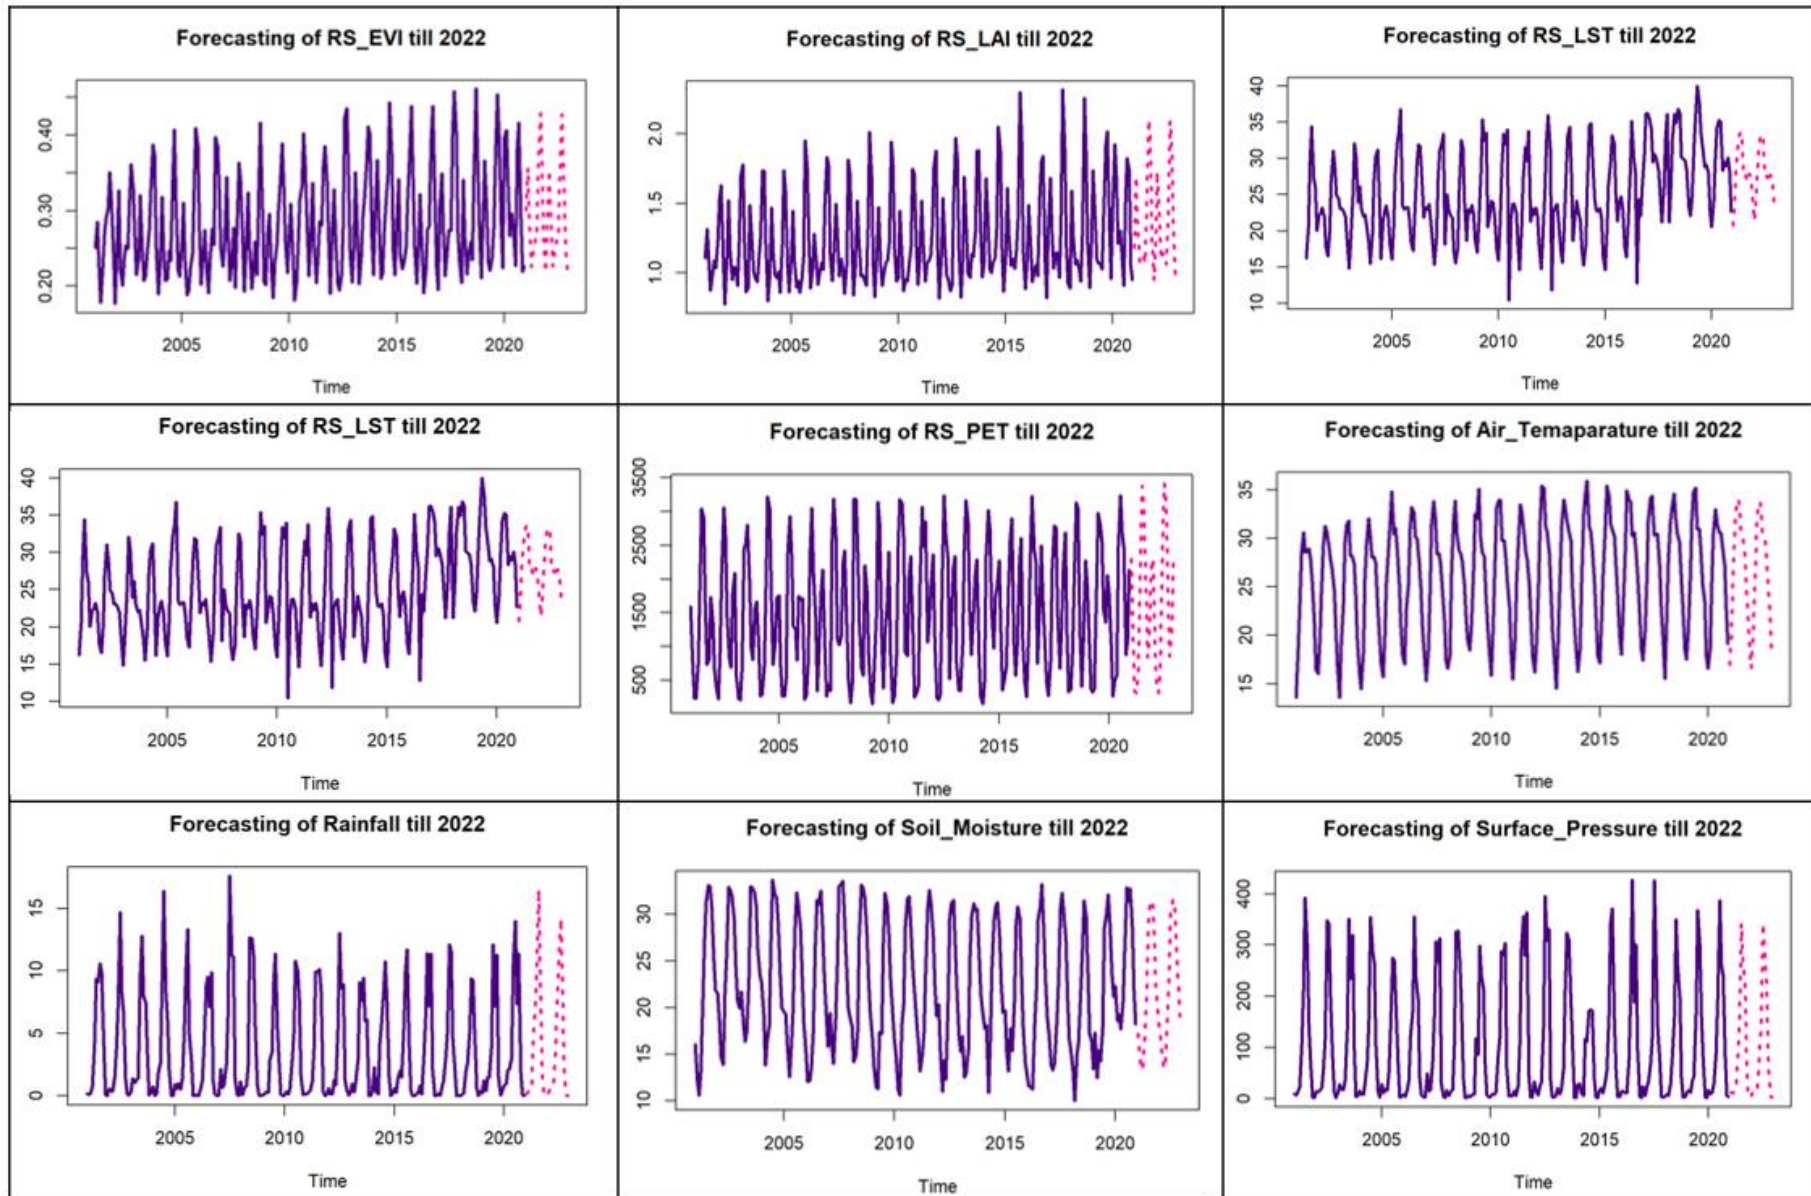

Risk Prediction of Theileriosis for the month of December 2022

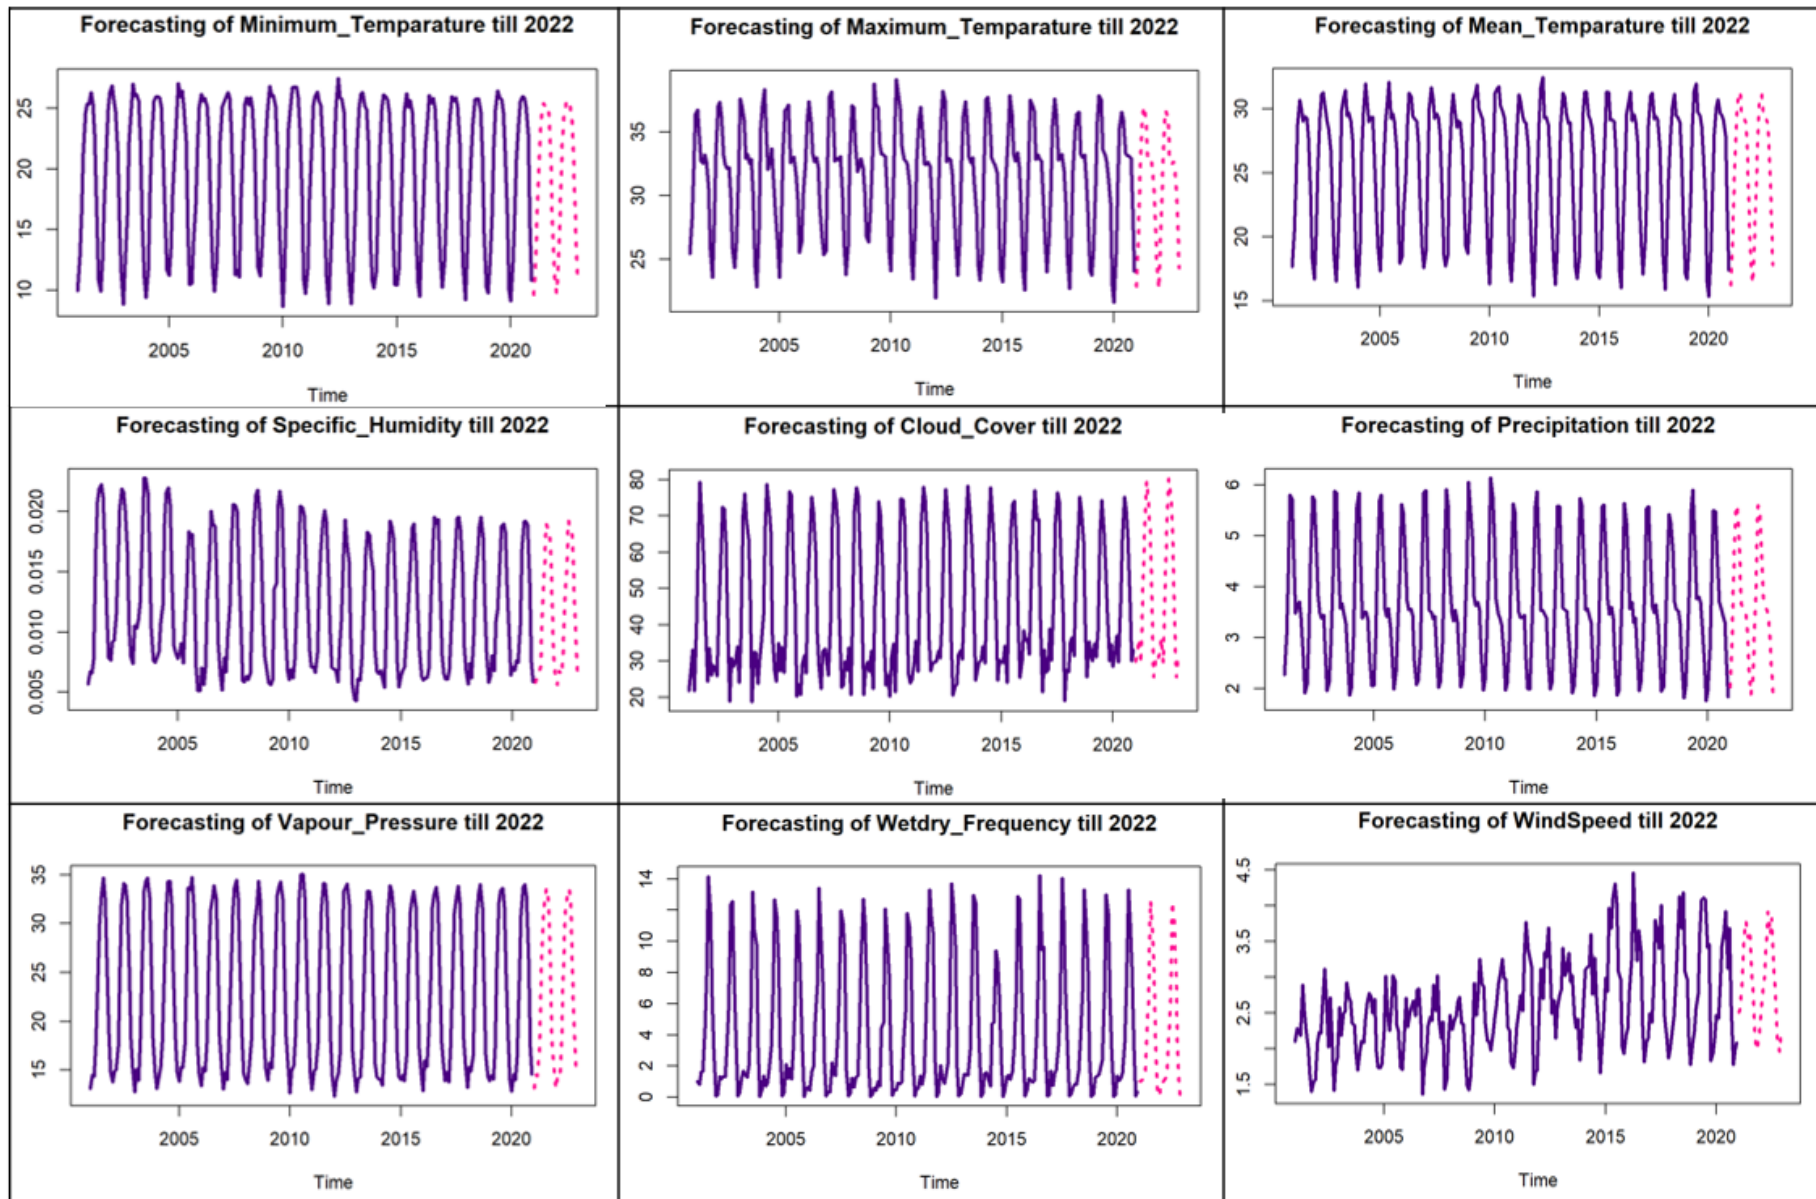

Risk Prediction of Trypanosomiasis for the month of December 2022

V. Forecasting of remote sensing and meteorological parameters till, 2022(*Ex. Karnataka*)

VI. SIGNIFICANT WEATHER PARAMETERS TABLE USING DISCRIMINANT FUNCTION ANALYSIS

Disease Names	Significant Parameters
Anthrax	Precipitable Water, Surface Pressure
Babesiosis	Air Temperature, Precipitation, Surface Pressure, Minimum Temperature, Vapour Pressure, Dew Point Temperature, Wind Speed, NDVI and LST Night
Black quarter	Precipitable Water, Precipitation, Surface Pressure, Sea Level Pressure and Vapour Pressure
Bluetongue	Air Temperature, Cloud, Precipitable Water, Precipitation, Surface Pressure, Uwind, Vwind, Vapour Pressure, Elevation, NDVI and PET
Classical Swine Fever	Cloud, Precipitation, relative humidity Minimum Temperature, Vapour Pressure and Rainfall
Enterotoxaemia	Surface Pressure, NDVI and PET
Fasciolosis	Air Temperature, Precipitation, relative humidity, Temperature, Maximum Temperature, Vapour Pressure, Vwind, Rainfall, Soil Moisture, NDVI and EVI
Foot and Mouth Disease	Precipitable Water, Uwind, Vwind, wet_dry frequency, LST Night and EVI
HaemorrhagicSepticaemia	Cloud, Precipitation and Vwind
Peste des Petits Ruminants	Cloud, Precipitable Water, Surface Pressure, Sea Level Pressure, Maximum Temperature, Vwind and NDVI
Sheep & Goat pox	Cloud, Surface Pressure, Maximum Temperature, Vwind, DTP, NDVI and PET
Theileriosis	Air Temperature, Precipitation, Vapour Pressure, NDVI and LST Night
Trypanosomosis	Air Temperature, Precipitation, Surface Pressure, Vapour Pressure, NDVI and LST Night

Table 7.1: Significant weather parameters govern the Livestock disease incidence (forecast).

9. POST PREDICTION VALIDATION

DIMAPUR | Publish Date: 4/14/2019 AH&VS TEAM VISITS AFFECTED AREAS UNDER MEDZIPHEMA, Source: <http://www.nagalandpost.com>

Following reports of a good number of buffaloes dying in a recent outbreak of suspected Haemorrhagic septicaemia (HS), a team from Animal Husbandry and Veterinary Services (AH&VS) department visited the affected areas under Medziphema on April 12. (Haemorrhagic septicaemia is a contagious bacterial disease that affects cattle and water buffaloes with a high mortality rate in infected animals).

AH&VS, deputy director & principal investigator, AICRP-ADMAS, Dr S. Arsenia Walling, in a press release reported that the team consisted of the department's director, Dr Temsumeren, along with additional director, Dr. Budhi Lama, and other officials from the department. The press release added that the area is prone to such kind of disease outbreaks and the department officials reminded villagers to cooperate with the department and vaccinate their animals against such outbreaks. The team told the villagers that even an outbreak can be contained more effectively if villagers report the matter on time to the nearest Veterinary Health Centre.

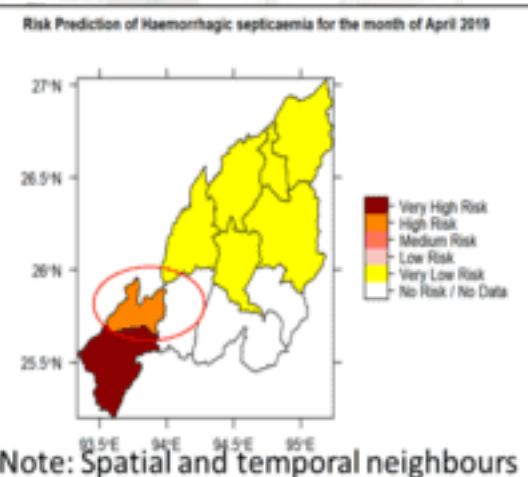

The villagers admitted in the meeting that they had not reported the recent outbreak to the department initially. The director appreciated the CVO Dimapur and his Rapid Response Team for their quick action after receiving information and for remaining stationed in the outbreak area to date. Free medicine was also distributed among the villagers. The department, through the press release also appealed to everyone to report such matters to the nearest Veterinary Health Centre (so that qualified staff may intervene quickly), instead of publicizing it in other ways. It stated that the department is prepared to extend services to any outbreak of diseases in animals to control such things.

The press release also pointed out that to control the recent outbreak, the department had to direct its officials to make their own transport arrangements to go to the affected areas because the State Election department did not consider an appeal to exempt the department's emergency duty vehicle from election duty.

Meanwhile, when contacted, Dr S. Amenla Walling told Nagaland Post that it is difficult to say if the disease has been fully contained since its free grazing season for the animals, but the department is doing its best under the circumstances.

 Source: The Hindu [edited]
<https://www.thehindu.com/news/national/kerala/steps-to-tackle-fmd-in-alappuzha/article34822360.ece>

The Animal Husbandry Department has ramped up measures to tackle the spread of foot-and-mouth disease (FMD) in Alappuzha.

Around 3000 head of cattle have been affected by the outbreak in the district in the last 1.5 months. At least 193 cattle died of the disease during the period. Around 550 head of cattle have contracted the disease, and 100 perished in the worst-affected Ambalapuzha South and Ambalapuzha North grama panchayats [for Kerala's decentralised administrative structure terminology, see <https://kerala.gov.in/local-self-government-Mod.AS>]. The disease has also been reported from Thakazhi, Thalavady, Edathua, Chettikulangara, Aryad, Pandanad, and Chengannur.

Treatment and vaccination are being carried out to check the spread of the disease. The department has deployed 140 teams in the affected areas. Special teams with doctors have been deployed to the worst-affected Ambalapuzha South and Ambalapuzha North grama panchayats. Doctors have been appointed to Chengannur, Ambalapuzha, and Veliyanad blocks to deal with emergencies during night.

Minister of Animal Husbandry J. Chinchurani said the department had taken measures to bring the outbreak under control.

District Animal Husbandry Officer A.G. Geo said the department had started a vaccination drive on 22 Apr [2021] soon after the FMD cases started to [be reported] in the district. As many as 6140 cattle in 51 grama panchayats have so far been vaccinated against FMD.

The outbreak of the disease was attributed to missed rounds of vaccination due to the COVID-19 pandemic.

FOOT AND MOUTH DISEASE - INDIA: (ARUNACHAL PRADESH) MITHUN, REQUEST FOR INFORMATION

A ProMED-mail post
<http://www.promedmail.org>
 ProMED-mail is a program of the
 International Society for Infectious Diseases
<http://www.isid.org>

Date: Tue 13 Apr 2021
 Source: Sentinel Assam [abridged, edited]
<http://www.sentinelassam.com/north-east-india-news/arunachal-news/many-mithuns-infected-with-fmd-foot-and-mouth-disease-533689>

A large number of mithuns have been affected by FMD (foot and mouth disease) in various parts of Arunachal Pradesh, and a few have died, said official sources on Monday (13 Apr 2021).

Animal Husbandry & Veterinary Department Deputy director Dr Taba Heli, a top mithun expert in North Eastern region, reported that the disease has taken a severe form in the entire Siang belt, particularly in East Siang, West Siang, and Upper Siang districts [map at <https://tinyurl.com/tft28s3c>].

Though the number of deaths is yet to be known, the disease has spread in

scattered areas of Papum Pare district also. The Department has allocated district funds for procurement of medicines to take all possible steps to contain the disease, he said. Mithun deaths have been reported also from Itanagar and Juliang area.

Pointing out that mithuns are the pride of indigenous people in the state, Nyishi Elite Society president Bengla Tolum has urged the department to take all possible steps to save them.

..

Communicated by:
 ProMED from HealthMap Alerts
promed@promedmail.org

(Mithun, also known as "Cattle of Mountain," is a bovine species of the northeastern hill region of India. This massive bovine is reared under free-range conditions in the hill forests at an altitude of 1000 to 3000 meters above mean sea level.

It is important to obtain information on the serotype and genotype of the virus strain involved, as well as of the vaccination history of the affected animals.

FMD is a disease of cloven-hoofed animals, including cattle, buffalo, small ruminants, and swine. It is the most contagious disease of mammal animals, having a great potential for causing severe economic loss in susceptible animals. Mortality, generally, is up to 2-3% but may be significantly higher in young stock.

The disease is regarded as endemic in India; effective mass vaccination, applying potent vaccines -- which include matching vaccine strains -- is essential for its control. Continued circulation of the virus may affect India's exports, such as frozen buffalo meat, of which India is the largest producer and exporter, globally. An example of the said export issue is to be found at <https://agriculture.govms.org/Documents/Report/foot%20and%20mouth%20disease.pdf>. - Mod.A5

ARUNACHAL PRADESH Risk Prediction of Foot and mouth disease for the month of April 2021

9.1 Correlational Assessment

The number of outbreaks predicted and outbreaks actually reported were mentioned in table 9.1. It has been observed from the table that outbreaks predicted two months in advance and timely alerts were issued that helped the stakeholders to take appropriate preventive measures with in time and accordingly the reported outbreaks were very less. Though the use of artificial intelligence system is more beneficial for accurately predicting the livestock disease outbreaks, there are yet number of limitations, namely, there are expected to be under reporting and also non-reporting cases which created the uncertainties in the model predictions while translating model inputs into model outputs. However, identifying these uncertainties in the prediction using statistical models and highlighting the importance of quality data may improve the model accuracy and confidence while building the model for livestock disease forecasting.

Table 9.1: Number of districts predicted for livestock diseases risk events and reported outbreaks

Sl No	Livestock diseases	July-2021		August-2021	
		No. of districts predicted for the disease risk events	No. of districts reported the disease outbreaks*	No. of districts predicted for the disease risk events	No. of districts reported the disease outbreaks*
1	Anthrax	35	3	32	7
2	Babesiosis	39	66	60	61
3	Black Quarter (BQ)	48	16	39	8
4	Bluetongue (BT)	0	1	0	0
5	Enterotoxaemia (ET)	18	7	19	6

10. LAUNCH OF MOBILE ANDROID APP&LINK TO DOWNLOAD

Livestock forewarning application (LDF) can be downloaded following the link provided: http://www.nivedi.res.in/android_nadres/LDF.apk and google play store link also provided <https://play.google.com/store/apps/details?id=info.androidhive.ldf>

Further launch of LDF application was done, the news provided below.

Livestock Disease Forewarning (LDF Mobile App)

The image displays three sequential screenshots of the Livestock Disease Forewarning (LDF Mobile App) interface. The first screenshot shows the home screen with a language selector, logos of ICAR, NIVEDI, and NADRES, and an 'About App' section. The second screenshot shows the main form with dropdown menus for disease name (Anthrax), state name (KARNATAKA), district name (Bagalkot), and month name (December), along with SUBMIT and RESET buttons. The third screenshot shows a 'Result' pop-up window displaying the disease name, state name, district name, month, and the result: 'Very Low Risk'.

To extend the reach of the NADRES forewarning bulletin among the various stakeholders, a Mobile Application named Livestock Disease forewarning app “LDF-Mobile App” was developed. The forewarning methodology adapted in the “mobile app” remains the same as monthly bulletin; it provides user interface to know the predicted forewarning results stored in NADRES MySQL database. A PHP web-based service is developed in Java to extract the results of forewarning two months in advance by keying state name, district name and disease name and display the same in the mobile app. In addition to forewarning, the LDF-Mobile App also provides the details of clinical samples to be collected in case of outbreaks of the listed diseases for laboratory confirmation and immediate preventive measures to be taken up in case of positive prediction/disease confirmation. The LDF mobile app is available at ICAR-NIVEDI website. It is available on Google play store.

11.FARMERS EMPOWERMENT THROUGH IT: DISEASE RISK COMMUNICATION (COLLABORATION WITH FRUITS, NIC, GOVT. OF KARNATAKA)

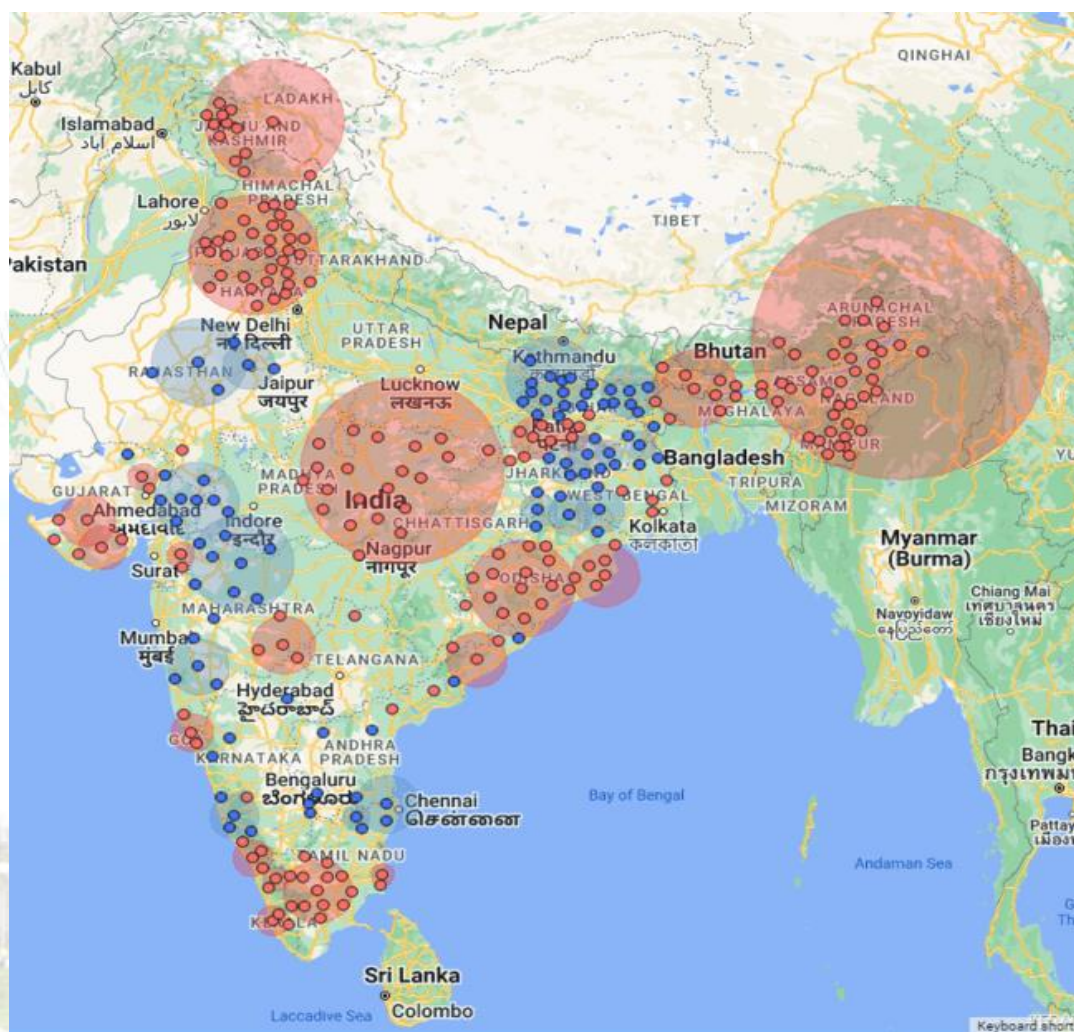

In addition to NADRES V₂ (The National Animal Disease Referral Expert System), ICAR-NIVEDI collaborated with NIC, Govt. of Karnataka, Karnataka State for sending the SMS alerts directly to the farmers who have registered in FRUITS (Farmers Registration and Unified Beneficiary Information System). The information alerts on risk prediction of three livestock diseases (FMD, Anthrax and Black Quarter) were sent through SMS to farmers is presented in Table 11.A. During September 2022, a total of **1579359** SMS alerts were sent to farmers.

Table 11.A: Number of famers received the SMS alert through FRUITS application during Septemberber 2022.

12.1 MODEL BASED HOT-SPOT AREA MAPS OF LIVESTOCK INFECTIOUS DISEASES IN INDIA

a) FMD Hotspot by Poisson Model: FMD in India (1989-2022)

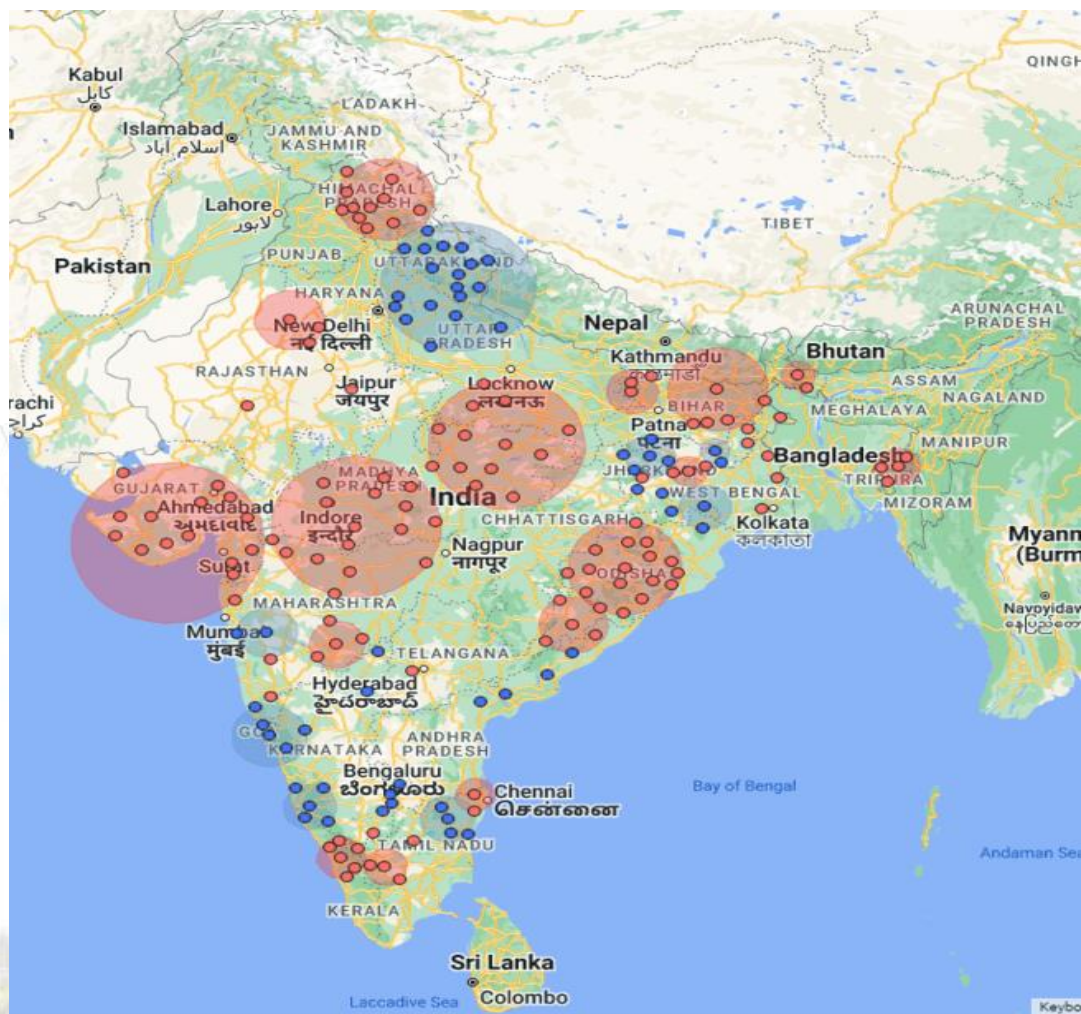

Model Specifications

- **Retrospective Analysis: Space-Time**
- **Probability Model: Space-Time Poisson Model**
 - With the Space-Time Poisson model, the number of cases in each location is Poisson-distributed.
 - The model requires case and population counts for a set of data locations and geographical coordinates for each of the locations.
 - SaTScan does a linear interpolation based on the population at the census times immediately preceding and following.
- **Advance Analysis Features:**
 - Circle radius:** 1 km.
 - Time Aggregation:** 1 year.
 - Output obtained with no geographical overlap-** Total hotspots-69 (High- 36, Low- 33).
 - The output is generated using **SaTScan v9. 6**.

Note: Red Dot: High Disease Cluster

Blue Dot: Low Disease Cluster

b) PPR Hotspot by Poisson Model: PPR in India (1995-2022)

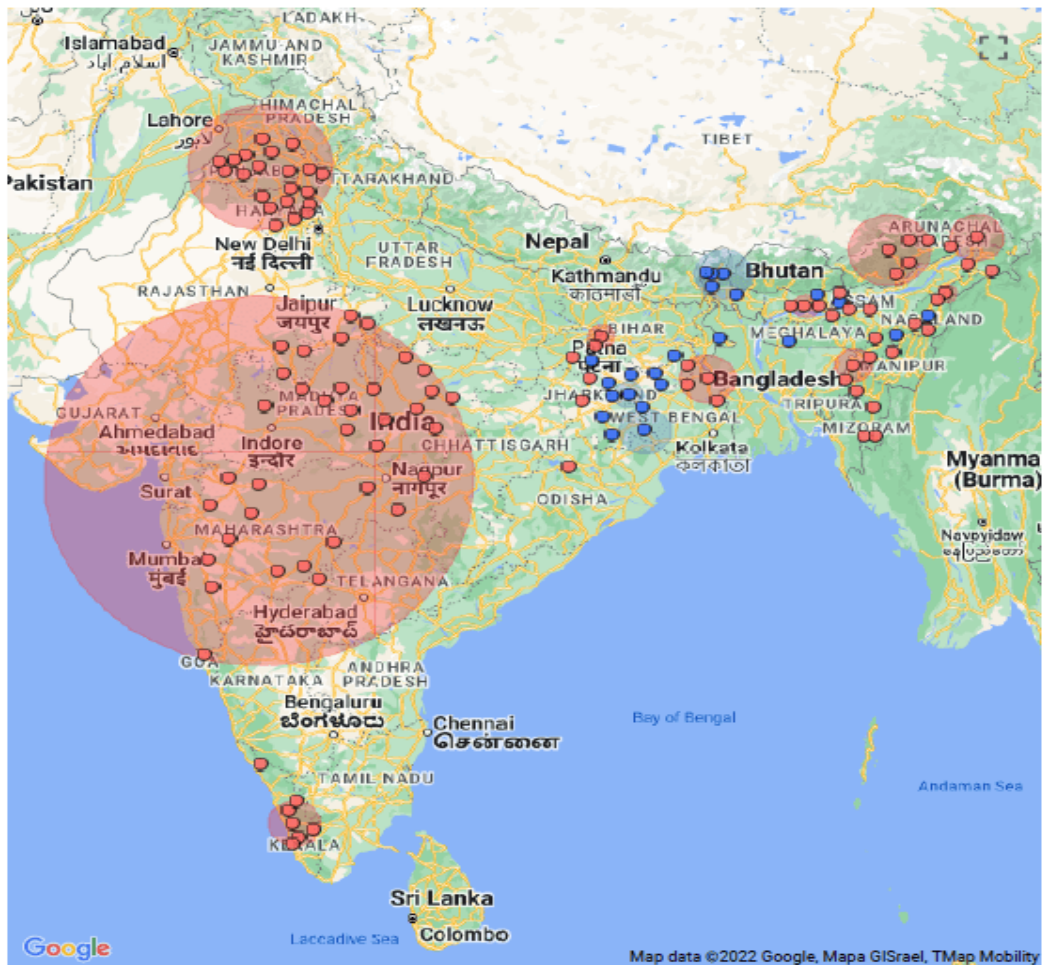

Model Specifications

- **Retrospective Analysis: Space-Time**
- **Probability Model: Space-Time Poisson Model**
 - With the Space-Time Poisson model, the number of cases in each location is Poisson-distributed.
 - The model requires case and population counts for a set of data locations and geographical coordinates for each of the locations.
 - SaTScan does a linear interpolation based on the population at the census times immediately preceding and following.
- **Advance Analysis Features:**
- **Circle radius:** 1 km.
- **Time Aggregation:** 1 year.
- **Output obtained with no geographical overlap-** Total hotspots– 51 (High- 30, Low- 21).
- The output is generated using **SaTScan v9. 6.**

Note: Red Dot: High Disease Cluster

Blue Dot: Low Disease Cluster

c) CSF Hotspot by Poisson Model: CSF in India (1992-2022)

Model Specifications

- **Retrospective Analysis: Space-Time**
- **Probability Model: Space-Time Poisson Model**
 - With the Space-Time Poisson model, the number of cases in each location is Poisson-distributed.
 - The model requires case and population counts for a set of data locations and geographical coordinates for each of the locations.
 - SaTScan does a linear interpolation based on the population at the census times immediately preceding and following.
- **Advance Analysis Features:**
 - Circle radius:** 1 km.
 - Time Aggregation:** 1 year.
 - Output obtained with no geographical overlap-** Total hotspots– 46 (High- 29, Low- 17).
 - The output is generated using **SaTScan v9. 6**.

Note: Red Dot: High Disease Cluster

Blue Dot: Low Disease Cluster

d) Bluetongue Hotspot by Poisson Model: Bluetongue in India (2001-2022)

Model Specifications

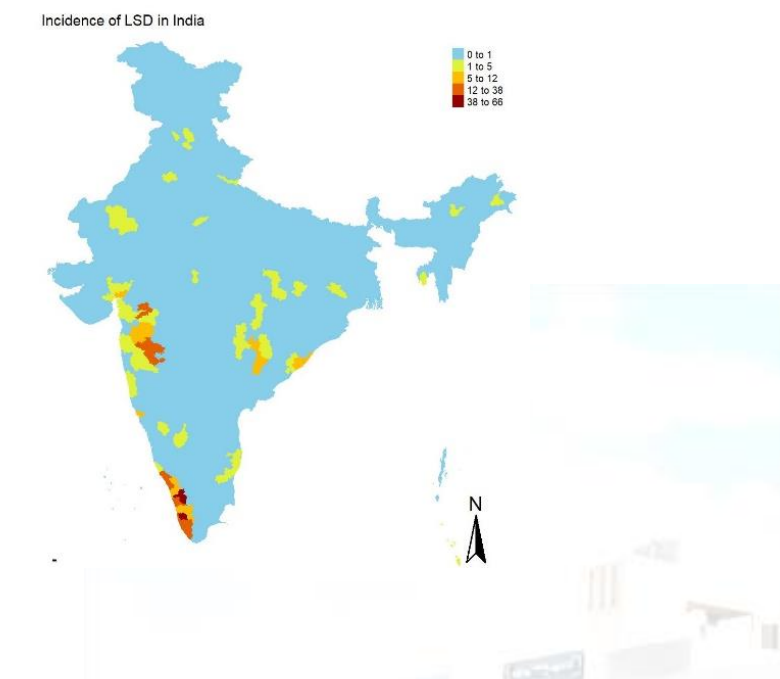

- **Retrospective Analysis: Space-Time**
- **Probability Model: Space-Time Poisson Model**
 - With the Space-Time Poisson model, the number of cases in each location is Poisson-distributed.
 - The model requires case and population counts for a set of data locations and geographical coordinates for each of the locations.
 - SaTScan does a linear interpolation based on the population at the census times immediately preceding and following.
- **Advance Analysis Features:**
- **Circle radius: 1 km.**
- **Time Aggregation: 1 year.**
- **Output obtained with no geographical overlap- Total hotspots- 14 (High- 7, Low- 7).**
- The output is generated using **SaTScan v9. 6.**

Note: Red Dot: High Disease Cluster

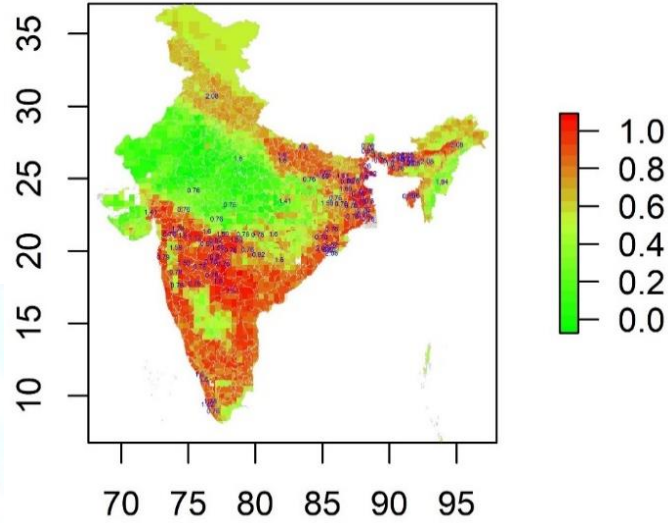

Blue Dot: Low Disease Cluster

doi: 10.14202/vetworld.2018.297-303 **How to cite this article:** Patil SS, Suresh KP, Saha S, Prajapati A, Hemadri D, Roy P (2018) Meta-analysis of classical swine fever prevalence in pigs in India: A 5-year study, *Veterinary World*, 11(3): 297-303.

Abstract

Aim: The aim of the study was to determine the overall prevalence of classical swine fever (CSF) in pigs in India, through a systematic review and meta-analysis of published data.

Materials and Methods: Consortium for e-Resources in Agriculture, India, Google Scholar, PubMed, annual reports of All India Coordinated Research Project on Animal Disease Monitoring and Surveillance, and All India Animal Disease database of NIVEDI (NADRES) were used for searching and retrieval of CSF prevalence data (seroprevalence, virus antigen, and virus nucleic acid detection) in India using a search strategy combining keywords and related database-specific subject terms from January 2011 to December 2015 in English only.

Results: A total of 22 data reports containing 6,158 samples size from 18 states of India were used for the quantitative synthesis, and overall 37% (95% confidence interval [CI]=0.24, 0.51) CSF prevalence in India was estimated. The data were classified into 4 different geographical zones of the country: 20% (95% CI=0.05, 0.55), 31% (95% CI=0.18, 0.47), 55% (95% CI=0.32, 0.76), and 34% (95% CI=0.14, 0.62). CSF prevalence was estimated in northern, eastern, western, and southern regions, respectively.

Conclusion: This study indicates that overall prevalence of CSF in India is much lower than individual published reports.

Keywords: Classical swine fever, India, meta-analysis, pigs, prevalence.

Abstract

Aim: The study aimed to determine the overall prevalence of livestock diseases in North Eastern Region (NER) of India, through a systematic review and meta-analysis of published data.

Materials and Methods: The articles used for the study were retrieved from PubMed, J-Gate Plus, Indian Journals, and Google scholar, R open-source scripting software 3.4.3. Metafor, Meta. The Chi-square test was conducted to assess for the heterogeneity, forest plot (confidence interval [CI] plot) is a method utilized to present the results of meta-analysis, displaying effect estimate and their CIs for each study were used for searching and retrieval of livestock diseases prevalence data in India using a search strategy combining keywords and related database-specific subject terms from 2008 to 2017 in English only.

Results: The prevalence of various livestock diseases are foot-and-mouth disease (21%), bluetongue (28%), brucellosis in bovine (17%), brucellosis in caprine (2%), brucellosis in porcine (18%), brucellosis in sheep and goat (3%), babesiosis (6%), theileriosis (26%), porcine reproductive and respiratory syndrome (1%), porcine cysticercosis (6%), classical swine fever (31%), *Porcine circovirus* (43%), and Peste des petits ruminants (15%). This information helps policymakers to take appropriate measures to reduce the disease burden.

Conclusion: This study indicates that the overall prevalence of various livestock diseases in NER of India.

Keywords: babesiosis, brucellosis, classical swine fever, foot-and-mouth disease, forest plot, livestock, meta-analysis, North Eastern regions, Peste des petits ruminants, *Porcine circovirus*, porcine cysticercosis, porcine reproductive and respiratory syndrome, prevalence, seroprevalence, theileriosis.

Abstract

Peste des petits ruminants (PPR) or goat plague is considered a leading, highly contagious, and most lethal infectious viral disease of small ruminants affecting the worldwide livestock economy and international animal trade. Although sheep and goats are the primarily affected, the PPR Virus (PPRV) host range has expanded to other livestock (large ruminants) and wildlife animals over the last few decades, resulting in serious concern to the ongoing PPR global eradication program, which is primarily optimized, designed, and targeted towards accessible sheep and goat population. A systematic review and meta-analysis study was conducted to estimate the prevalence and spill-over infection of PPRV in large ruminants (bovine and camel) and wildlife. Published articles from 2001 to October 2021 on the "PPR" were searched in four electronic databases of PubMed, Scopus, Science direct, and Google Scholars. The articles were then selected using inclusion criteria (detection/prevalence of PPRV in bovine, camel, and wildlife population), exclusion criteria (only sheep or goats, lack of prevalence data, experimental trial, test evaluation, and reviews written in other languages or published before 2001), and the prevalence was estimated by random effect meta-analysis model. In the current study, all published articles belonged to Africa and Asia. The overall pooled prevalence of PPR estimates was 24% (95% CI: 15-33), with 30% in Asia (95% CI: 14-49) and 20% in Africa (95% CI: 11-30). The overall estimated pooled prevalence at an Africa-Asia level in bovine and camel was 13% (95% CI: 8-19), and in wildlife, it was 52% (95% CI: 30-74) with significant heterogeneity ($I^2 = 97\%$) in most pooled estimates with a high prevalence in atypical hosts and wildlife across Asia and Africa. Over the last two decades, the host range has increased drastically in the wildlife population, even for prevalent PPR in the unnatural hosts only for a short time, contributing to virus persistence in multi-host systems with an impact on PPR control and eradication program. This observation on the epidemiology of the PPRV in unnatural hosts demands appropriate intervention strategies, particularly at the livestock-wildlife interface.

14. APPLICATION OF BIOINFORMATICS FOR UNDERSTANDING THE DYNAMICS OF LIVESTOCK INFECTIOUS DISEASES

- a) **An extensive analysis of Codon usage pattern, Evolutionary rate and Phylogeographic reconstruction in Foot and mouth disease (FMD) serotypes (A, Asia 1 and O) of six major climatic zones of India: A Comparative study**

Abstract

Foot and mouth disease (FMD) is a major economically important viral disease of clovenhoofed livestock globally. The FMD virus (FMDV) spreads widely in confined, cool and humid climatic conditions. Being an RNA virus, FMDV is genetically unstable, and its genome evolution is highly influenced by the mutational pressure. The climatic and environmental conditions have a significant impact on mutational pressure. The present study is a primary effort to establish a comprehensive relationship between climatic factors and molecular evolutionary pattern of serotypes FMDV circulating in India. In this study, isolates of three serotypes (A, Asia 1 and O) were selected from six major climatic zones of India (Montane, Humid subtropical, Tropical wet and dry, Tropical wet, Semi-arid and Arid). Based on the full genome nucleotide sequence data, the codon usage bias, evolutionary and phylogeographic analysis were carried out. The study revealed that the codon use bias indicators in the FMDV serotypes differed significantly depending on the climatic zones. It implies that the selection and mutational pressure influence the codon usage pattern indices (eNC, CAI, RCDI, GRAVY, Aromo), with mutational pressure taking precedence in determining the codon usage bias of the FMDV genome. The tMRCA was estimated to be 1960, 1956 and 1961 for Indian FMD virus serotype-A, Asia 1 and O respectively, which is around 17, 29 and 36 years before its actual identification in the field. Virus transmission across the region was evident from phylogeographic analysis. The integrated analysis of codon usage bias, evolutionary rate and phylogeography analysis signifies the major role of mutational and selection pressure, implying that the in FMD virus co-evolution and adaptations are highly influenced by the climatic/environmental factors.

- b) **Relative Analysis of Codon Usage and Nucleotide Bias between Anthrax Toxin Genes Subst**

Inpxo1 Plasmid of *Bacillus Anthracis*

Abstract

Anthrax is an ancient and acute illness that affects a large quantity of animal species and is caused by a bacterium *Bacillus anthracis*, which is a rod-shaped, gram-positive and spore forming bacterium. Virulent forms of *B. anthracis* has two large pathogenicity related plasmids pXO1 and pXO2. pXO1 has the different anthrax toxin genes *cya*, *lef*, and *pagA* where as pXO2 has the genes accountable for capsule synthesis and degradation, *capA*, *capB*, *capC*, and *capD*. *B. anthracis* express its pathogenic activity mostly over the capsule and the manufacture of a toxic compound involving three proteins known as edema factor (EF), lethal factor (LF) and protective antigen (PA). These two enormous plasmids of *B. anthracis* are crucial for full pathogenicity, exclusion of either of the plasmids extremely weakens the malignity of *B. anthracis*. In the current study we conducted the relative analysis of the codon usage and nucleotide bias of virulent genes subsist in pXO1 plasmid of *B. anthracis*. Codon usage bias not only plays a substantial role at the extent of gene expression, but also supports to improve the efficacy and accurateness of translation. Codon usage pattern analysis of *B. anthracis* genome is essential for understanding the evolutionary characteristics in the different species. To examine the codon usage arrangement of

the *B.anthraxis* genome, Nucleotide sequences of the virulent genes viz *cya*, *lef* and *pag* were collected from National Center for Biotechnology Information (NCBI). The correlations between GC3s, whole GC content, Effective No. of Codons (ENC), Codon Adaptation Index (CAI), Codon Bias Index (CBI), Frequency of Optimal Codons (FOP), General average hydropathicity (Gravy) and Aromaticity (Aroma), of the selected genes were determined. The ENC-plot i.e., ENc values vs GC3s, Pr2 plot i.e., relationship between A3 / (A3 +T3) and G3 / (G3 +C3), Neutrality plot i.e., GC12 versus GC3s, and the RSCU of the genes, all shows codon usage bias existence in all the virulent genes subsists in pXO1 plasmid of *B.anthraxis* genome. These results expresses the codon usage bias existing in the pXO1 plasmid's virulent genes of *B.anthraxis* genome could be utilized for further exploration on their evolutionary analysis as in design of primers, design of transgenes, determine of origin of species as well as prediction of gene expression level and gene function.

c) Reverse vaccinology based *in silico* analysis of Epitope prediction in *cya*, *lef* and *pag* Genes from *Bacillus anthracis* against Anthrax infected species: An Immunoinformatics approach

Abstract

Bacillus anthracis is a Gram-positive spore-forming bacterium that causes the zoonotic disease: anthrax, an abrupt illness that disproportionately impacts grazing livestock and wild ruminants. Anthrax's geographical reach despite years of research on anthrax epizootic and epidemics behaviour, to date, remains to be elucidated. Existing therapeutics, however, are ineffective in combating this infectious disease, necessitating the development of a better vaccine to pause the pandemic using immunoinformatics approaches, this study intended to predict an efficient epitope for a vaccine against anthrax in animals and humans of the toxin genes such as *cya*, *lef* and *pagA* of *B.anthraxis* against anthrax. The B-cell and T-cell epitopes were predicted utilizing various bioinformatics tools/software and docking analysis was performed. Consequently, it was found that the evaluated epitopes had no allergenicity, no toxicity and had high antigenicity that provides an effectual and most rapid technique to estimate peptide synthetic vaccines to impede anthrax.

15. IMPACT OF CLIMATE CHANGE ON LIVESTOCK DISEASE INCIDENCE

15.1 Southern States Temperature Humidity Index (THI) 2001-2021

THI for 2001

THI for 2011

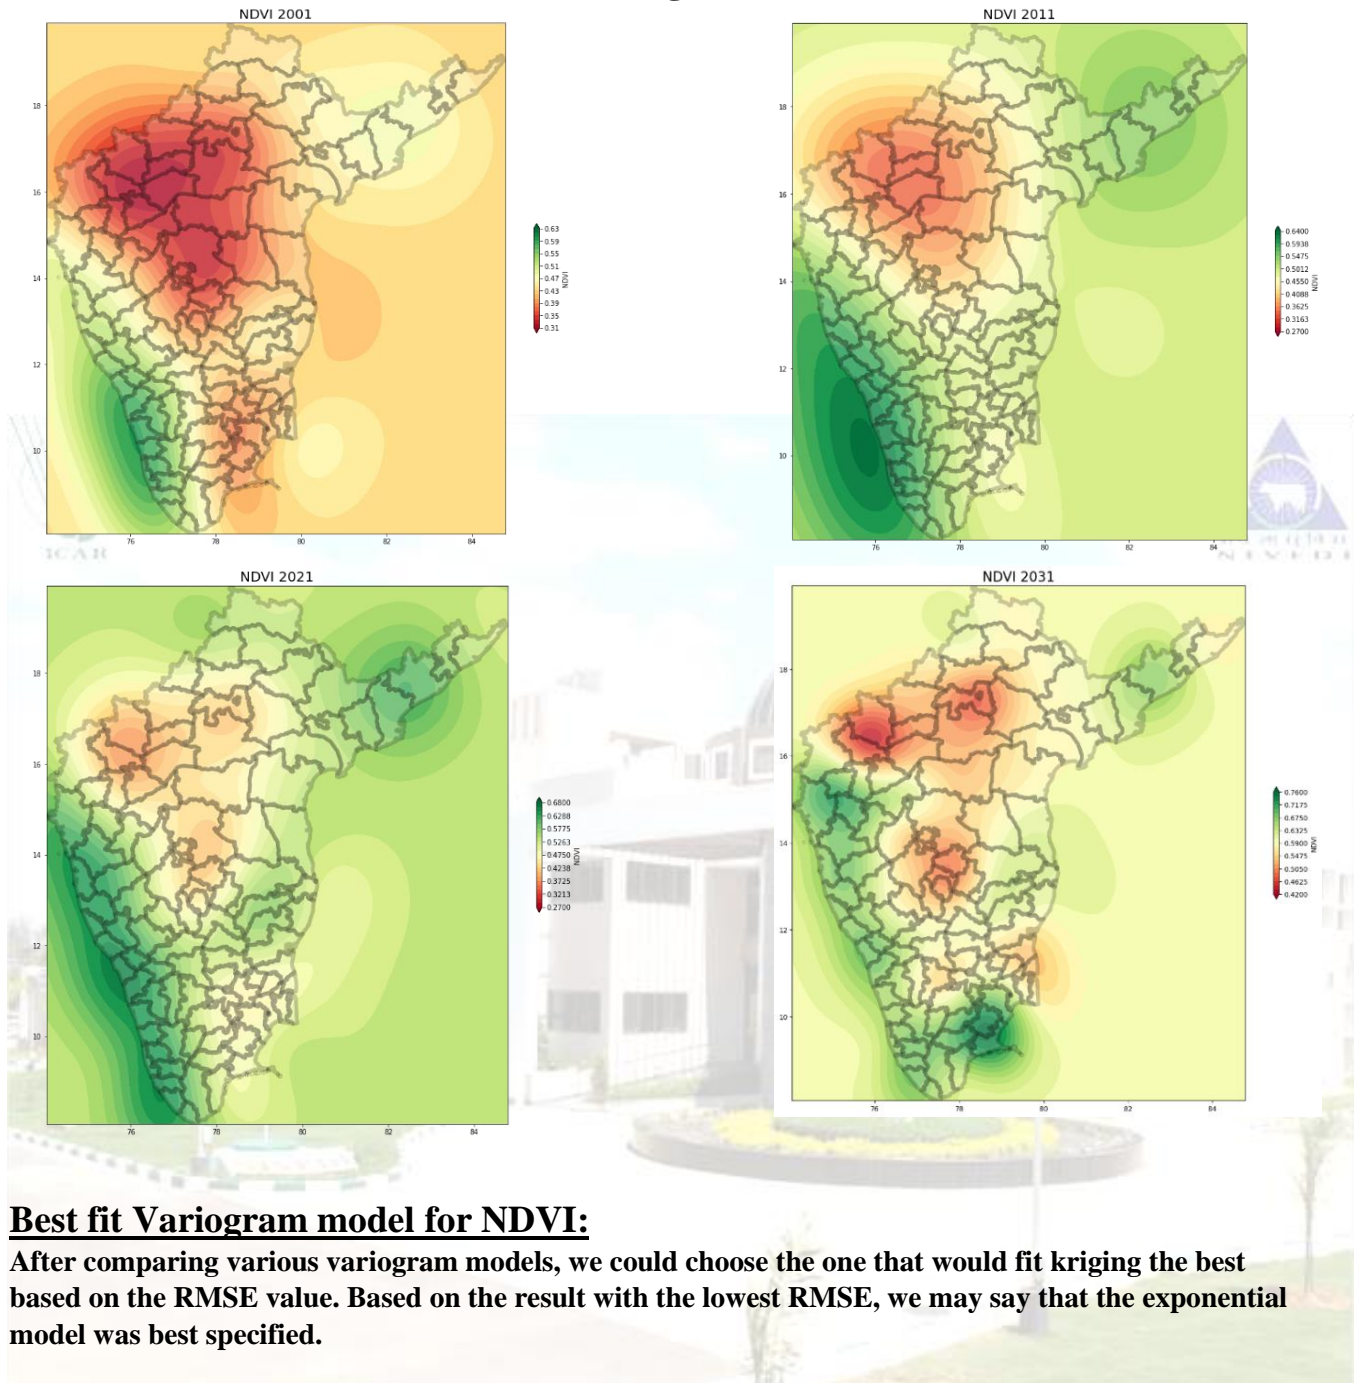

THI for 2021

THI for 2023 (Predicted)

15.2. Southern States Normalized Difference Vegetation Index (NDVI)

Best fit Variogram model for NDVI:

After comparing various variogram models, we could choose the one that would fit kriging the best based on the RMSE value. Based on the result with the lowest RMSE, we may say that the exponential model was best specified.

Kriging Results

Models:

- **Ordinary Kriging:** Ordinary Kriging is a spatial estimation method where the error variance is minimized
- **variogram_model:** Gaussian Model
 $p \cdot (1 - e^{-d^2/(47r)^2}) + n$

Variables are defined as:

dd = distance values at which to calculate the variogram

pp = partial sill (psill = sill - nugget)

rr = range

nn = nugget

ss = scaling factor or slope

ee = exponent for power model

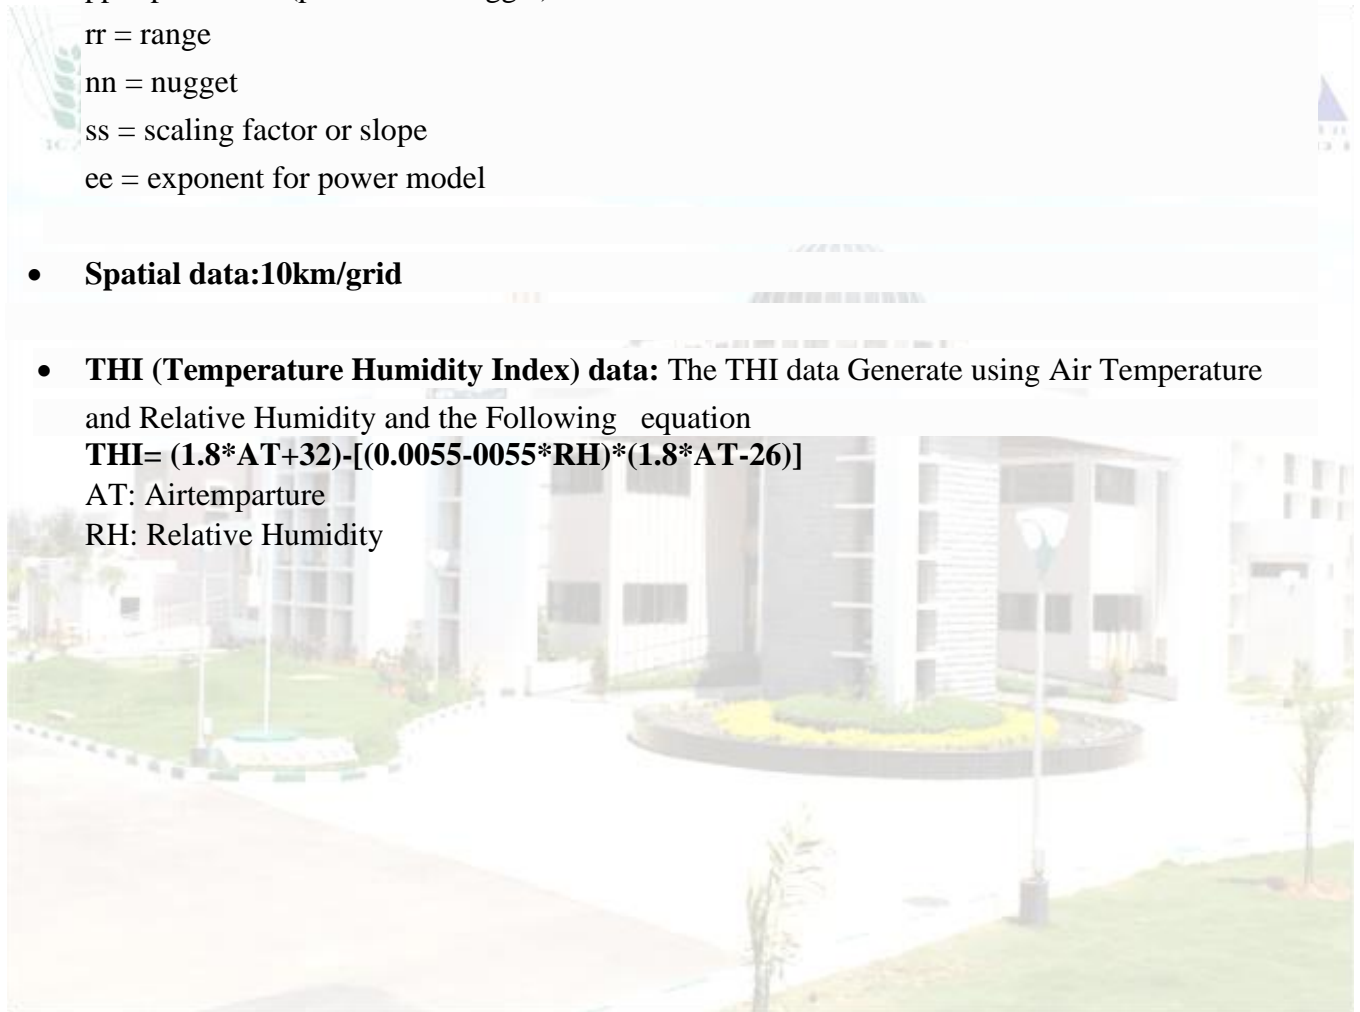

- **Spatial data: 10km/grid**

- **THI (Temperature Humidity Index) data:** The THI data Generate using Air Temperature and Relative Humidity and the Following equation

$$THI = (1.8 \cdot AT + 32) - [(0.0055 - 0.0055 \cdot RH) \cdot (1.8 \cdot AT - 26)]$$

AT: Airtemparture

RH: Relative Humidity
