FOREWORD

Foot and Mouth Disease (FMD) is an important contagious transboundary animal disease (TAD) in the world, caused by different serotypes and many genotypes of FMD virus, posing constant threat to livestock husbandry and food security locally and globally. FMD is widely prevalent in most parts of Africa, West Eurasia, Asia and the Middle East. About 70 countries are free from FMD but always under threat of virus incursion from endemic countries. Spread of the disease occurs through contaminated air, water, feed, fomites, livestock movement and trade etc. The burden of FMD in developing countries is usually underestimated. The disease threatens livelihood security and associated with reduced productive performance of farm animals and economic losses. As suggested by FAO, with a fast-moving infection, surveillance is essential and building up national and regional epidemio-surveillance capacities is a priority. The direct economic impact of FMD is attributed to drop in milk production, abortions, and death of young calves. The indirect adverse effect includes loss of draught power, the cost of treatment, trade embargo by FMD free countries and implementation of FMD control programme. In India, annual direct loss is estimated at Rs. 20,000 (about 3.5bn USD) crore. Indirect loss due to trade barrier could be much more. Controlling FMD and reducing its economic impact would improve livelihood of farming community and will have huge impact on both FMD endemic and non-endemic countries. As we know the FMD control strategy includes: (1) Mass awareness (2) Mass vaccination (3) Post vaccinal Seromonitoring (4) Serological Surveillance (5) Disease detection and reporting in real-time (5) Management of risks in virus spread and prevent escape of virus from laboratories. Govt. of India has taken lots of initiatives to control the disease in India. Recently the Union Cabinet has granted considerable amount of money on priority basis to control FMD in next five years by mass vaccination and subsequent eradication of the disease from India. Post vaccination seromonitoring is essential to assess the efficacy of vaccine or vaccination in the fields. Sero surveillance is essential to understand the prevalence of the disease. Considering the huge livestock resource of the country, two-stage sampling plan is very important for systematic collection of representative samples and thereafter testing in laboratories. The sampling plan provided in this bulletin is the guideline for collection of samples from different parts of the country to be tested for FMD vaccine induced antibody response under FMDCP and National FMD Sero surveillance. I thank the Directors and Scientists of ICAR-NIVEDI and ICAR-D FMD for taking initiatives to prepare this useful bulletin to be used in FMDCP of the country.

Foreword

Foot and mouth disease (FMD) is a highly contagious viral disease primarily of cattle, buffalo and pigs. Other animals such as sheep, goats and several other species of wild/captive animals including elephant are also susceptible to the disease/ virus. The disease has been a major constraint for international trade of livestock and animal products.

In order to control FMD and to minimize the losses, it is necessary to strengthen the National FMD control programme in line with Guidelines laid down by FAOs-Progressive Control Pathway (PCP). For FMD control proper vaccination schedule and monitoring of post vaccination activities is essential. Software for generating OIE recommended two stage sampling plan which takes into account of sensitivity and specificity of diagnostic tests, systematic collection of random, representative and independent samples for disease surveillance, prevalence and monitoring of vaccine induced antibody response under FMD Control Programme (FMDCP) is essentially required.

I am happy that ICAR-National Institute of Veterinary Epidemiology and Disease Informatics (NIVEDI) has also brought out a bulletin of sampling plan in particular for collection of samples under National FMD Control Programme, which would be more useful for getting the critical information regarding FMD sero-surveillance and for FMD vaccine induced antibody response. I am sure the document will help to strengthen the control programme in a long way.

I congratulate the Directors and Scientists of ICAR-NIVEDI and ICAR-Directorate of Foot and Mouth Disease (DFMD) for taking initiatives to prepare this bulletin to be used in FMDCP of the Country.

(J.K. Jena)

ACKNOWLEDGEMENTS

Authors would like to express their sincere gratitude to Secretary DARE and Director General, ICAR, Ministry of Agriculture & Farmer`s Welfare, for his constant guidance and support in bringing out this bulletin on sampling plan for FMD CP

It is to place on record our acknowledgement to Deputy Director General (Animal Science) for his valubles suggestions and moral support in bringing out this bulletin on sampling plan for FMDCP.

Our special thanks are due to Department of Animal husbandry, dairying and Fisheries, Ministry of Agriculture & Farmer`s Welfare, Government of India, New Delhi for their encouragement in planning to bring this bulletin.

Authors thank all the Scientists of ICAR-NIVEDI and ICAR-DFMD for their inputs in bringing this bulletin.

We also thank our research fellows working in Spatial Epidemiology lab of ICAR-NIVEDI for their hard work in programming and technical assistance in generating sampling plan

FMD Serosurveillance

Introduction and objectives

In general, surveillance is aimed at demonstrating the absence of disease or infection, determining the presence or distribution of disease or infection or detecting as early as possible exotic or emerging diseases. The type of surveillance applied depends on the outputs needed to support decision-making (OIE, 2018).

Animal health surveillance is also a tool to monitor disease trends, to facilitate the control of disease or infection, to provide data for use in risk analysis, for animal or public health purposes, and to substantiate the rationale for sanitary measures. Both domestic animals and wildlife are susceptible to certain diseases or infections. However, the presence of a disease or infection in wildlife does not mean it is necessarily present in domestic animals in the same country or zone or vice versa. Wildlife may be included in a surveillance system because they can serve as reservoirs of infection and as indicators of disease risk to humans and domestic animals (OIE, 2018).

The objective of serosurveillance of FMD in India

1. To provide the Sampling Scheme for estimation of total number of animals to be sampled, total number of villages (epi units) to be selected, number of animals within the village to be sampled and location of villages for surveillance of FMD in India.

National FMD Serosurveillance

In India, vaccination with inactivated vaccine is the primary mode of FMD control. There is challenge to identify the infected animals among the vaccinated animals for appropriate implementation of the control programme. Differentiation of these two categories of animals is important during serological surveys to detect evidence of infection, as a follow up to ring vaccination in FMD free countries and for import/ export serology. During active viral replication following FMD virus infection, arrays of non structural proteins (NSPs) are produced that elicit anti-NSP antibodies, which is not the case in animals which are vaccinated against FMD with inactivated virus vaccine. A recombinant 3AB3 non structural protein based

ELISA test for differentiation of FMD virus infected from vaccinated animals (DIVA) has been developed. This indigenously developed rDIVA-FMD kit, amenable to mass scale comprehensive serosurveillance has been designed as per the OIE approved guidelines and is at least four-fold cheaper than the commercial DIVA kits available on import. The diagnostic sensitivity and specificity of this kit is 95% and 98%, respectively. Now this kit is in extensive use in the country as a companion diagnostic in the National FMD control programme. Use of DIVA assay is essential in identification of potential disease free zones (DFZs) with vaccination in India.

Sampling Strategy currently used for Serosurveillance

For 3AB3-NSP based serosurveillance activity, 200 bovine serum samples (animals 6 months- 18 months of age) per annum were collected at random from various districts of India. The sample size (n=200)/district has been arbitrarily calculated. However, the experts of the OIE FMD Mission to India suggested that a two-stage sampling strategy with a minimum design prevalence of 1% between the first-stage level (village) and 5% between the village should be followed for NSP serosurveillance. The two-stage sampling strategy for NSP serosurveillance would be followed for FMD-Disease free Zones (DFZ) as soon as possible. The current sampling design was developed jointly by ICAR-NIVEDI and ICAR-DFMD. For NSP serosurveillance, the study design usually focusses on younger animals (**6 months to 18 months old animals**) since repeated vaccination even with good quality vaccine can generate positive signal in NSP ELISA that may provide false positive. Risk based sampling strategies may be more effective than simple random sampling.

Table 1: NSP antibody prevalence

Note: For states/UT with unknown prevalence, the rate of NSP prevalence of adjacent states were used as baseline for estimation of sample size under OIE recommended Two-stage stratified random sampling. States where NSP -antibody prevalence is less than 5%, OIE recommended prevalence of 5% was used for preparation of sampling plan.

Recommended Two -stage sampling plan for serosurveillance

All form of epidemiological investigations requires the scientific sampling plan for collection of data on health problems includes serum samples in a specific population. Estimation of frequency of disease is a prerequisite to establish the disease control program, hence sampling the populations in order to estimate the disease frequency is common task for epidemiologists. In sampling, we ensure that animals are typical of the target population that the estimate of disease frequency is unbiased and precise (low standard error). Simple random sampling, systematic or stratified random samplings are the most commonly used sampling methods in which the animal is sampling unit, provides the precise estimates of disease frequency.

In a large population where animals are separated into herds (villages can be treated as herd in some country where herd information is not available), disease has a strong tendency to cluster. This is because the disease agent or agents (whether infectious, environmental or genetic) are generally not evenly distributed throughout the population. With rare diseases, this clustering is usually even more pronounced. As a result, a very low proportion of herds may be affected

by a particular disease-but within those affected herds, the prevalence of the disease amongst animals may be quite high. If a survey designed to detect the presence of disease fails to take into account the clustering of disease in the population, the results of the survey are likely to be very unreliable. This is because the probability formulae that the surveys are based on assume that every unit in the population has the same probability of being affected. Another problem with large-area surveys is the logistics of sampling. Probability formulae assume simple random sampling. Simple random sampling of individual animals from a national herd requires the creation of a sampling frame which may need to list millions of animals (each uniquely identified). Such a sampling frame is usually impossible to construct.

The solution to both these problems is to use a two-stage sampling strategy in which herds form the first stage, and individual animals within selected herds, the second stage. In this way, the sample sizes at each stage can be adjusted to reflect the different disease prevalence's (the proportion of herds affected in the first stage, and the proportion of animals affected in the herd at the second stage). Two-stage sampling also means that the construction of sampling frames is much simpler. At the first stage, only a list of all herds or villages (defined epi unit) in the population is required, and at the second stage, only animals in each of the selected herds is to be included in the list. However, the use of two-stage sampling presents particular problems for sample-size calculation and analysis.

The use of two-stage sampling has evolved to meet surveillance objectives for two reasons. First, list of frames of animals for randomized sample selection do not typically exist at a regional or national level, but the list frames of herds can be developed and maintained more readily.

In this scheme we employed stratified random sampling with district as stratification variable for buffalo and cattle population in different states. The input requirement of sampling were animal level prevalence, cluster or herd level prevalence obtained from previous study or reports as presented in Table 1, Sensitivity and Specificity of tests were also accounted for while generating sampling plan. Two -stage stratified random sampling plan was generated at 95% confidence using in-house developed epi-calculator https://nivedi.res.in/Nadres_v2/Epical/stratified/random_sampling.php. Sampling plan will provide the guidelines for selecting villages and its location like block, district and state level information along with livestock population, number of animals to be sampled within village, and proportion of buffaloes and cattle to be sampled in each selected village. The abstract of sampling plan generated using two-stage stratified random sampling scheme is presented in Table 2.

Table 2: Summary of sampling plan using Two-stage stratified random sampling technique for serosurveillance of FMD in India

**** 20th Livestock Census (DAHD, GoI)**

Animals of 6 months to 18 months of age to be sampled, samples to be collected preferably 4 to 5 months after previous vaccination

Guidelines for Collection and transport of serum samples

1. Serum should be collected using a sterile needle and syringe
2. At least 2 ml of serum should be submitted to the testing laboratory and for that 4-8 ml whole blood needs to be collected without anticoagulant.
3. The blood is usually collected from the jugular vein
4. After collection, the sample should be allowed to stand in a cool area, out of direct sunlight for at least 15 minutes to allow clot formation
5. Serum should be separated before submission to the laboratory.
6. The sample should be centrifuged or, if this is not available, stand the sample in an upright position overnight in a cool box or refrigerator
7. Place serum into a plain, sterile tube and send to the laboratory under cool condition
8. If dispatch to a laboratory is delayed, serum samples should be frozen and stored at -20 °C
9. Samples should be accompanied by proper epidemiological data sheet

Stratified Random Sampling - Andaman And Nicobar Islands (Code -1)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 5 + (Cattle + Buffalo) = 302

Design Level Prevalence = 0.11

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 95

Total No of Animals to be Sampled = 1615

Stratified Random Sampling - Andhra Pradesh (Code -2)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 100 + (Cattle + Buffalo) = 14778

Design Level Prevalence = 0.05

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 287

Total No of Animals to be Sampled = 10332

Stratified Random Sampling - Arunachal Pradesh (Code -3)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 50 + (Cattle + Buffalo) = 1579

Design Level Prevalence = 0.2041

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 127

Total No of Animals to be Sampled = 1651

Stratified Random Sampling - Assam (Code -4)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 100 + (Cattle + Buffalo) = 19446

Design Level Prevalence = 0.2041

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 2145

Stratified Random Sampling - Bihar (Code -5)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 12974

Design Level Prevalence = 0.35

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.95

Total No of Villages (Clusters) Selected = 241

Total No of Animals to be Sampled = 2410

Stratified Random Sampling - Chhattisgarh (Code -7)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 8312

Design Level Prevalence = 0.162

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 2640

Stratified Random Sampling - Jammu And Kashmir (Code -14)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 1913

Design Level Prevalence = 0.2455

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 1815

Stratified Random Sampling - Jharkhand (Code -15)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 7588

Design Level Prevalence = 0.35

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.95

Total No of Villages (Clusters) Selected = 241

Total No of Animals to be Sampled = 2410

Stratified Random Sampling - Karnataka (Code -16)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 6867

Design Level Prevalence = 0.23

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 1980

Stratified Random Sampling - Kerala (Code -17)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 100 + (Cattle + Buffalo) = 4598

Design Level Prevalence = 0.05

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 287

Total No of Animals to be Sampled = 10332

Stratified Random Sampling - Madhya Pradesh (Code -19)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 20453

Design Level Prevalence = 0.162

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 2640

Stratified Random Sampling - Maharashtra (Code -20)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 12965

Design Level Prevalence = 0.05

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 287

Total No of Animals to be Sampled = 10332

Stratified Random Sampling - Mizoram (Code -23)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 50 + (Cattle + Buffalo) = 264

Design Level Prevalence = 0.142

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 85

Total No of Animals to be Sampled = 1615

Stratified Random Sampling - Odisha (Code -25)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 4321

Design Level Prevalence = 0.4486

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.95

Total No of Villages (Clusters) Selected = 241

Total No of Animals to be Sampled = 1928

Stratified Random Sampling - Puducherry (Code -26)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 50 + (Cattle + Buffalo) = 164

Design Level Prevalence = 0.29

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 67

Total No of Animals to be Sampled = 469

Stratified Random Sampling - Rajasthan (Code -28)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 18444

Design Level Prevalence = 0.286

Cluster Level Prevalence = 0.015

Sensitivity of the test used = 0.95

Total No of Villages (Clusters) Selected = 209

Total No of Animals to be Sampled = 2508

Stratified Random Sampling - Sikkim (Code -29)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 100 + (Cattle + Buffalo) = 382

Design Level Prevalence = 0.2041

Cluster Level Prevalence = 0.04

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 82

Total No of Animals to be Sampled = 1066

Stratified Random Sampling - Uttar Pradesh (Code -33)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 33593

Design Level Prevalence = 0.094

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 332

Total No of Animals to be Sampled = 9296

Stratified Random Sampling - West Bengal (Code -35)

Species Selected for Stratification = Cattle + Buffalo

Number of Villages Having 500 + (Cattle + Buffalo) = 11580

Design Level Prevalence = 0.50

Cluster Level Prevalence = 0.03

Sensitivity of the test used = 0.95

Total No of Villages (Clusters) Selected = 160

Total No of Animals to be Sampled = 1120
