FOREWORD

Bovine brucellosis often leads to abortion in infected cows, this is also known as contagious abortion or Bang's disease. Bovine brucellosis is a serious disease of livestock that has significant animal health, public health, and international trade consequences. Apart from the productivity losses in animals, the disease may affect humans by direct contact or consumption of unsterilized milk or milk and meat products. The most common symptoms in humans are fever, night sweats, asthenia, insomnia, anorexia and headache. Brucellosis can be treated in human beings but not recommended in animals due to its high cost of treatment and often occurrence of unfavorable outcome. Bovine brucellosis is a menace to livestock farming and the animal handlers. Controlling of bovine brucellosis will certainly improve livelihood of farming community by improving economic bearing and improve public health security. To avoid the disease in endemic countries, along with other measures, vaccination is recommended to control this disease. Department of Animal Husbandry and Dairying, Govt. of India has taken initiatives to control bovine brucellosis by vaccinations and evaluation of its efficacy by sero-monitoring and sero-surveillance. Considering the huge livestock resource in India, while studying vaccination efficacy, two-stage sampling plan is very important for systematic collection of representative samples and thereafter testing in laboratories. The sampling plan provided in this handbook is the guideline for collection of samples from different parts of the country to be tested for bovine brucella vaccine induced antibody response or infection induced antibody response under bovine brucellosis control programme.

I compliment the Director and Scientists of ICAR-NIVEDI for taking initiatives to prepare this useful handbook to be used in bovine brucellosis control programme in India.

Foreword

Brucellosis is a bacterial zoonotic disease affecting animals and human beings and causes enormous economic loss in domestic animals and considerable morbidity in humans. The livestock affected include cattle, sheep, goats, pigs, camels, mithun etc. Brucellosis causes abortions, infertility and milk reduction in animals. Also high brucellosis prevalence in animals poses greater risk of disease transmission to animal handlers, veterinarians and other risk groups. The disease is considered a major obstacle in international trade of livestock and animal products. Hence, the Government of India has come up with a policy of Brucellosis control program in cattle with calf hood vaccination with *Brucella abortus* S19 vaccine between 4-8 months of age.

To understand the coverage of vaccination in calves in different states of India, ICAR-NIVEDI has come out with this technical bulletin consisting of sampling plan for monitoring the vaccination in calves and serosurveillance in adults. In addition, it is also required to understand the baseline prevalence for any control program so that success of the program can be monitored over the years. To address this component, sampling plan for serosurveillance has been included in this bulletin so that baseline prevalence of brucellosis can be obtained during the initial period and incidence and success of the program can be monitored subsequently.

I am happy that ICAR-NIVEDI has brought out this bulletin on sampling plan which will provide more critical information for making a road map for control program. I also congratulate the Director and scientists for their systematic and meticulous work for bringing out this bulletin and for their participation in the control program.

(B.N. Tripathi)

PREFACE

Bovine brucellosis is one of the important and economically catastrophic contagious reproductive disease of sexually matured livestock and other animals. Total estimated average loss due to this disease is USD 1357 in cattle and USD 1918 in buffaloes (Singh *et al.*, 2015). Brucellosis is caused by a coccobacillary, microaerophilic, Gram negative organism of genus *Brucella*. Different species of *Brucella* are responsible for the reproductive disease of livestock, *Brucella abortus* is the dominant species in the cattle. Brucellosis is the most common zoonosis in the world. Considering the damage done by the *Brucella* infection in livestock in terms of decrease in productivity that impact the negatively on development in the economy.

Brucellosis is a zoonosis highly infectious for humans causing a disease often called undulant fever or Malta fever, since it was first recognized in Malta during the 1850s. Symptoms in humans include intermittent or irregular fever, headache, weakness, profuse sweating, chills, weight loss and general aching. Infections of organs including the liver and spleen may also occur. Veterinarians, farmers, and abattoir workers are vulnerable to infection as they handle infected animals and aborted fetuses or placentae. Brucellosis is one of the most easily acquired laboratory infections, and strict safety precautions should be observed when handling cultures and heavily infected samples, such as products of abortion. The disease can also spread to people through consumption of unpasteurized milk coming from infected animals.

The use of two-stage sampling scheme has evolved to meet surveillance or monitoring objectives for two reasons. First, list of frames of animals for randomized sample selection do not typically exist at a regional or national level, but the frame of herds or villages can be developed and maintained more readily, Secondly, the theory and application of sampling within herd or village is well developed. The purpose of this bulletin development is to provide the guidelines for estimation of total number of animals to be sampled, total number of villages (epi units) to be selected, number of animals within the village to be sampled and location of villages for post seromonitoring of Bovine Brucellosis in 4-8 months of female calves (less than 1 year old female calf population) in India to estimate the unbiased and robust estimate of protection levels of Brucellosis in 4-8 months of female calves (less than 1 year old female calf population) in India.

I profusely thank Secretary, DARE and Director General, ICAR and DDG (AS), ICAR for their constant support and guidance in bringing this bulletin.

ACKNOWLEDGEMENTS

The authors would like to express their sincere gratitude to Secretary, DARE and Director General, ICAR, Ministry of Agriculture and Farmer's Welfare, GOI, New Delhi for his constant guidance in bringing out this bulletin on sampling plan for Brucellosis Control Programme.

It is to place on record our acknowledgement to Deputy Director General (Animal Science), ICAR, New Delhi for his valuable suggestions and support in bringing out this bulletin.

Our special thanks are due to Department of Animal Husbandry and Dairying, GOI, New Delhi for their encouragement in planning to bring out this bulletin.

Authors also thank Dr. Surendra Pal, Assistant Commissioner (AH), DAHD, GOI, New Delhi for his timely help in providing data on prevalence of Brucellosis in India.

Our thanks are due to Dr Rajeswari Shome, Principal Scientist, Mr. G.S. Mohan Kumar and Ms. Rashmi R Kurli and other Research Fellows of Disease Informatics Laboratory, ICAR-NIVEDI, Bengaluru for their valuable input and technical assistance.

Brucellosis Control Programme: Seromonitoring (Post vaccination)

Bovine brucellosis is one of the important and economically catastrophic contagious reproductive disease of sexually matured livestock and other animals. Total estimated loss due to this disease is USD 1357 in cattle and USD 1918 in buffaloes (Singh *et al.*, 2015). Brucellosis is caused by a coccobacillary, microaerophilic, Gram negative organism of genus *Brucella*. Different species of *Brucella* are responsible for the reproductive disease of livestock, *Brucella abortus* is the dominant species in the cattle. Brucellosis is the most common zoonosis in the world. Considering the damage done by the *Brucella* infection in livestock in terms of decrease in productivity that impact the negatively on development in the economy.

The disease in animals is characterized by abortions or reproductive failure. While animals typically recover, and will be able to have live offspring following the initial abortion, they may continue to shed the bacteria. Brucellosis is typically spread when the animal aborts or gives birth. High levels of bacteria are found in the birth fluids of an infected animal. The bacteria can survive outside the animal in the environment for several months, particularly in cool moist conditions. They remain infectious to other animals which become infected by ingesting the bacteria. The bacteria also colonise the udder and contaminate the milk. The disease can also infect animals and humans through cuts in the skin, or through mucous membranes.

Typically, the disease is mild, with the infected animal showing few signs until she aborts. There may be swelling of the testicles in males, and occasionally the bacteria localize in the joints causing arthritis. The importance of Brucellosis is that it causes poor reproductive performance, due to abortions, infertility, retention of placenta, stillbirth or birth of weak offspring. It results in huge economic losses to dairy, sheep, goat and pig farmers.

Brucellosis is a zoonosis highly infectious for humans causing a disease often called undulant fever or Malta fever, since it was first recognized in Malta during the 1850s. Symptoms in humans include intermittent or irregular fever, headache, weakness, profuse sweating, chills, weight loss and general aching. Infections of organs including the liver and spleen may also occur. Veterinarians, farmers, and abattoir workers are vulnerable to infection as they handle infected animals and aborted fetuses or placentae. Brucellosis is one of the most easily acquired laboratory infections, and strict safety precautions should be observed when handling cultures and heavily infected samples, such as products of abortion. The disease can also spread to people through consumption of unpasteurized milk coming from infected animals.

Seromonitoring of Bovine Brucellosis under Brucella Control Programme (BCP)

Bovine brucellosis is endemic in almost all the states of India. This disease can be prevented over a period of time by one time vaccination of all eligible female calves. Brucellosis-Control Programme envisages vaccination of female calves between 4-8 months in all states. This component was implemented since 2010 and central assistance is being provided to States/UTs for mass vaccination of all female calves between 6-8 months (Now 4-8 months) in the areas where incidence of the disease is high.

Surveillance using serological tests, as well as tests on milk like the milk ring test, can be used for screening and play an important role in campaigns to eliminate the disease. As well individual animal testing both for trade and for disease control purposes is practiced.

The objective of Seromonitoring of Bovine Brucellosis in India

1. To provide the sampling scheme for estimation of total number of animals to be sampled, total number of representative villages (epi units) to be selected, random number of animals within the village to be sampled and location of villages for seromonitoring (Post vaccination) of Bovine Brucellosis in 4-8 months of female calves (less than 1-year-old female calf population) in India.

Recommended Two-stage Stratified Random Sampling Method

All form of epidemiological investigations requires the scientific sampling plan for collection of data on health problems includes serum samples in surveillance or monitoring in a specific population. Estimation of frequency of disease is a prerequisite to establish the disease control program, hence sampling the populations in order to estimate the disease frequency is common task for epidemiologists. In sampling, we ensure that animals are typical of the target population that the estimate of disease frequency is unbiased and precise (low standard error). Simple random sampling, systematic or stratified random samplings are the most commonly used sampling methods in which the animal is sampling unit, provides the precise estimates of disease frequency.

The use of two-stage sampling scheme has evolved to meet surveillance or monitoring objectives for two reasons. First, list of frames of animals for randomized sample selection do not typically exist at a regional or national level, but the list frames of herds or villages can be

developed and maintained more readily. Second, the theory and application sampling within herd or village is well developed.

In this sampling scheme we employed stratified random sampling with district as stratification variable for buffalo and cattle population in different states. The input requirements of sampling plan were

- (1) Animal level prevalence of un-protection for brucellosis ($1-P(\text{protection})$) is 20% (clinical assumption of at least 80% of livestock population get protection after vaccination) is used for population of females calves less than 8 months under the uniform distribution,
- (2) Cluster or village level prevalence (Unprotection levels) of 20%, 15% ,10% and 5% used under classification of states based on proportion of study population such as for small(states having study population up to 1.5%) , medium (states having study population up to 5%) large (states having study population up to 10 %) and very large states(states having study population more than 10%).
- (3) sensitivity of 90% and specificity of 100% of diagnostic tests were used.

Two -stage stratified random sampling plan was generated at 95% confidence using in-house developed using epi-calculator under NADRES v2 by ICAR-NIVEDI, Bengaluru : https://nivedi.res.in/Nadres_v2/Epical/stratified/random_sampling.php. Sampling plan will provide the guidelines for selecting villages and its location like block, district and state level information along with livestock population, number of animals to be sampled within village, and proportion of buffaloes and cattle to be sampled in each selected village. The summary of sampling plan generated using two-stage stratified random sampling scheme is presented in Table 1.

Table 1. Sampling plan generated using two-stage stratified random sampling method for Seromonitoring(Post vaccination) of Brucellosis in India

Note: Female calves between 4-8 months of age to be sampled for sero-Monitoring (Post vaccination) of brucellosis in a selected village

*20th LIVESTOCK CENSUS REPORT, ADHD, GOI, NEW DELHI

Collection and transport of serum samples

- Serum should be collected using a sterile needle and syringe
- At least 2ml of serum should be submitted to the testing laboratory and for that 4-8 ml whole blood needs to be collected without anticoagulant.
- The blood is usually collected from the jugular vein
- After collection, the sample should be allowed to stand in a cool area, out of direct sunlight for at least 15 minutes to allow clot formation
- Serum should be separated before submission to the laboratory.
- The sample should be centrifuged or, if this is not available, stand the sample in an upright position overnight in a cool box or refrigerator
- Place serum into a plain, sterile tube and send to the laboratory under cool condition
- If dispatch to a laboratory is delayed, serum samples should be frozen and stored at -20° C
- Samples should be accompanied by proper epidemiological data sheet

Stratified Random Sampling - Bihar (Code - 10)

Species Selected for Stratification = under_1year_Fbovine

Number of Villages Having 100 + (under_1year_Fbovine) = 10953

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 332

Total No of Animals to be Sampled = 4316

Stratified Random Sampling - Rajasthan (Code - 8)

Species Selected for Stratification = under_1year_Fbovine

Number of Villages Having 100 + (under_1year_Fbovine) = 8968

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.02

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 165

Total No of Animals to be Sampled = 2145

Stratified Random Sampling - Uttar Pradesh (Code -9)

Species Selected for Stratification = under_1year_Fbovine

Number of Villages Having 100 + (under_1year_Fbovine) = 13723

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 332

Total No of Animals to be Sampled = 4316

Stratified Random Sampling - West Bengal (Code - 19)

Species Selected for Stratification = under_1year_Fbovine

Number of Villages Having 100 + (under_1year_Fbovine) = 11191

Design Level Prevalence = 0.2

Cluster Level Prevalence = 0.01

Sensitivity of the test used = 0.9

Total No of Villages (Clusters) Selected = 332

Total No of Animals to be Sampled = 4316
